# Keynote - Implementation of a High-Quality Lung Cancer Screening Program

**David Tom Cooke, MD**
**Professor**
**UC Davis**

Dr. David Tom Cooke is a Professor at the University of California, Davis School of Medicine. He is the founding Chief of the Division of General Thoracic Surgery, Director of the General Thoracic Surgery Robotics Program, the Vice Chair for Faculty Development and Wellness for the Department of Surgery, the Associate Director for the Office of Inclusivity, Diversity, Equity and Accessibility (IDEAL) and the Interim Physician-in-Chief, UC Davis NCI designated Comprehensive Cancer Center. Dr. Cooke specializes in the surgical treatment of malignant and benign lung and esophageal disease and is a national leader in robotic thoracic surgery. Dr. Cooke's research includes oncologic trials, surgical outcomes/health services research, patient-centered outcomes research, surgical education, medical social media, and public medical communication. He has authored over 100 peer-reviewed publications. He is president of the Thoracic Surgery Directors Association, a director of the American Board of Thoracic Surgery, a director of the Accreditation Council for Graduate Medical Education (ACGME), member of the American Surgical Association and an associate member of the American College of Surgeons Academy of Master Surgeon Educators. Dr. Cooke currently serves on the American Lung Association National Lung Cancer Expert Medical Advisory Panel. Dr. Cooke completed his cardiothoracic surgery training at the University of Michigan in Ann Arbor, general surgery residency at the Massachusetts General Hospital in Boston, medical school at Harvard Medical School and undergraduate at UC Berkeley.

## Lung cancer kills more Men AND Women…

**Lung Cancer > Breast Cancer + Prostate Cancer + Colon Cancer**

American Lung Association
State of Lung Cancer
2023

•Close to **238,000** people will be diagnosed with lung cancer this year, with the rate of new cases varying by state.
•Lung cancer has one of the lowest five-year survival rates because cases are often diagnosed at later stages, when the disease is less likely to be curable. The national average of people alive five years after a lung cancer diagnosis is **26.6%**
•Nationally, only **26.6%** of cases are diagnosed at an early stage.

## Menthol Cigarette Smokers

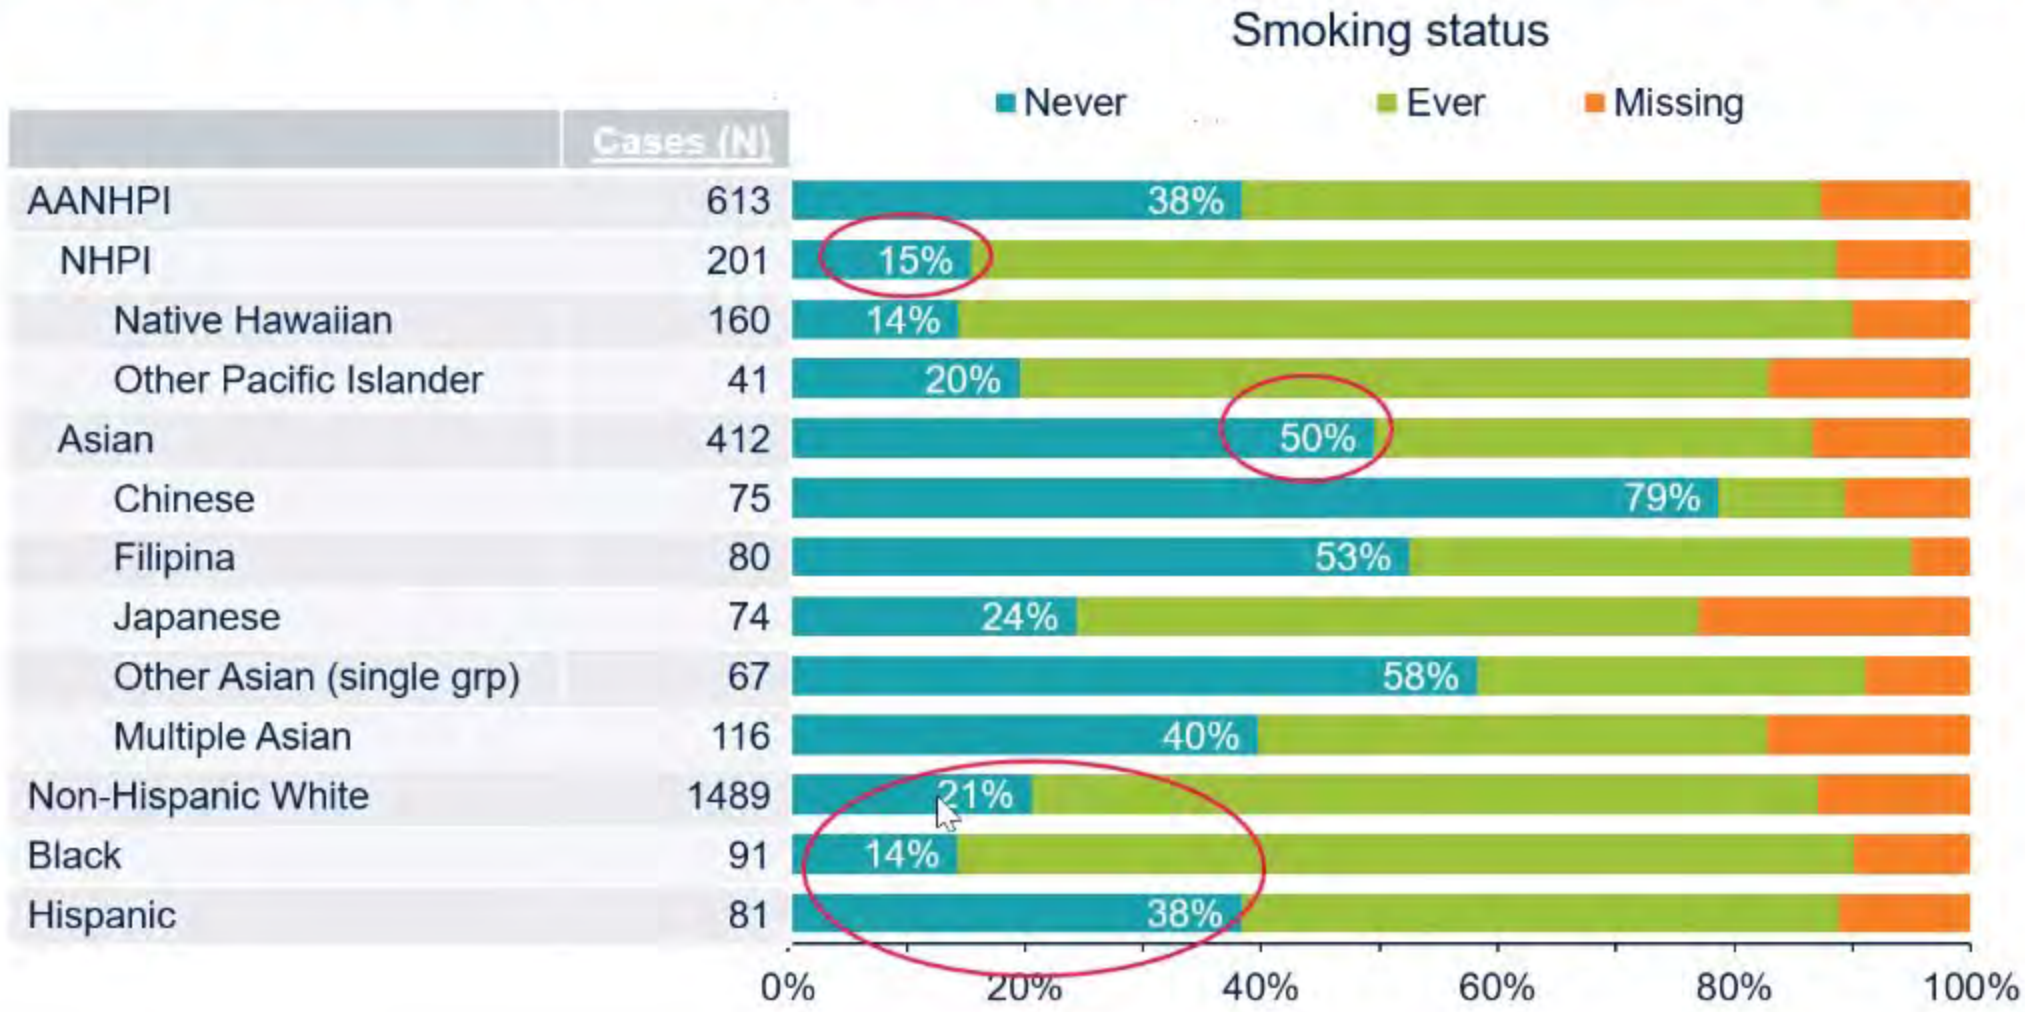
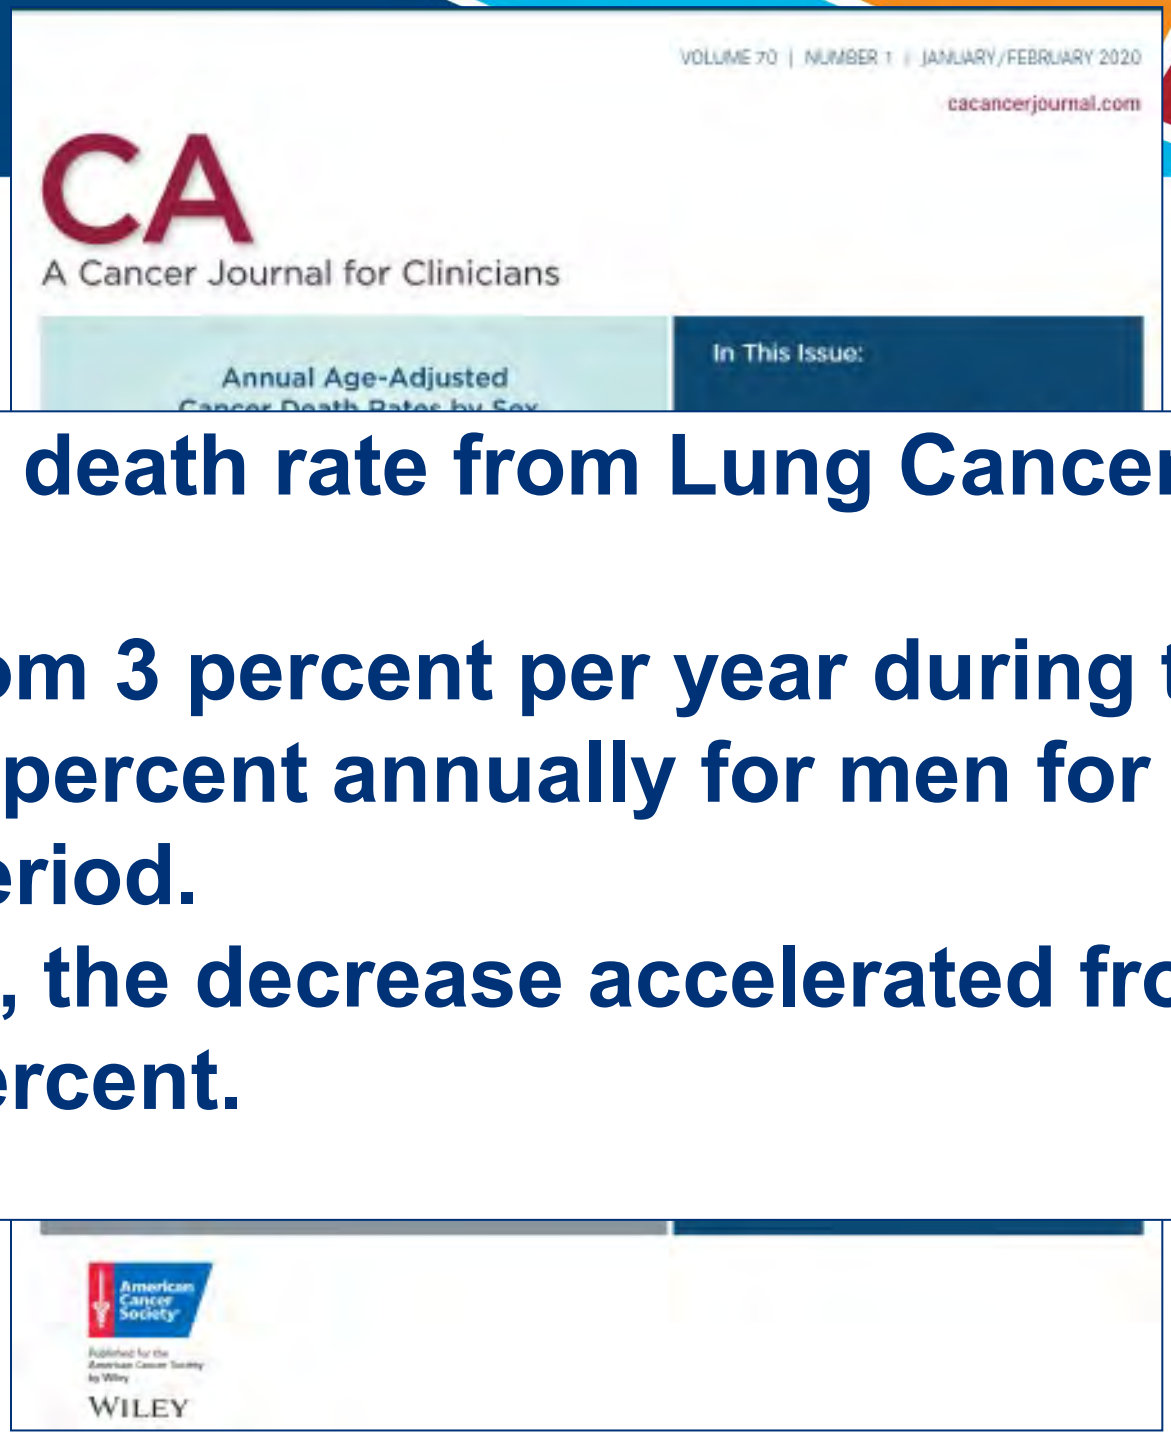
| Non-Hispanic White | 1489 |
| Black | 91 |
| Hispanic | 81 |



DeRouen, et al. CEBP, 2021

Morris CR, Movsisyan A, Hofer BM, Parikh-Patel A, Keegan THM, Cooke DT, Wun T.

- **Compared with White patients, Black/African American patients were more likely to be diagnosed at late-stage disease.**
- **Late stage at diagnosis was examined for six screen-detectable cancers: female breast, cervical, colorectal, prostate, lung, and oropharyngeal cancers. A significantly higher percentage of Black/African American (vs. White) patients with lung (78.4 vs. 72.9 percent), and other cancers were diagnosed at late stage.**



# Decline in the death rate from Lung Cancer:

- Sped up from 3 percent per year during the 2008-2013 period to 5 percent annually for men for the following five-year period.
- For women, the decrease accelerated from 2 to almost 4 percent.

UC DAVIS HEALTH | COMPREHENSIVE CANCER CENTER

# Cancer Disparities

- Cancer mortality rates among Black/African American men declined by 2.3 percent per year for all cancers combined.
- Among Black/African American women, cancer mortality rates for all cancers combined declined as well, by 2.1 percent per year.

## New Data

- **Black/AA smokers have a higher risk of lung cancer and at lower levels of smoking intensity than White smokers[1]**
- **Latino/Hispanics who smoke accumulate fewer pack-years than White smokers[2,3]**
- **Women accumulate fewer pack-years than men[4]**

1. N Engl J Med. 2006;354(4):333-342.
2. Am J Prev Med. 2014;46(5):496-506.
3. Tob Induc Dis. 2016;14:23
4. N Engl J Med. 2013;368(8):728-736.

## New Data

- **Southern Community Cohort Study participants found that 17% of Black/AAs who smoke were eligible for lung cancer screening based on the 2013 USPSTF eligibility criteria compared with 31% of White smokers.**
- **Among those diagnosed with lung cancer, only 32% of Black/AA persons who smoke were eligible for screening compared to 56% of White smokers.**

JAMA Oncol. 2019;5(9):1318-1324.

# Disparities in Access

- African-Americans are more likely to die from Lung Cancer than White Americans.  But African-Americans are screened less.
- However, African-Americans may have a higher incidence of positive screening exams.
- **When detected by screening, AA exhibit the same survival advantage and lower stage detection as their white counterparts.**

Pasquinelli MM, et al. JAMA Oncol. 2018;4(9):1291-1293.

# USPSTF New Recommendations

| | |
|---|---|
| What does the USPSTF recommend? | Adults aged 50 to 80 years who have a 20 pack-year smoking history and currently smoke or have quit within the past 15 years:<br>• Screen for lung cancer with low-dose computed tomography (CT) every year.<br>• Stop screening once a person has not smoked for 15 years or has a health problem that limits life expectancy or the ability to have lung surgery.<br>Grade: B |
| How often? | • Screen every year with low-dose CT.<br>• Stop screening once a person has not smoked for 15 years or has a health problem that limits life expectancy or the ability to have lung surgery. |

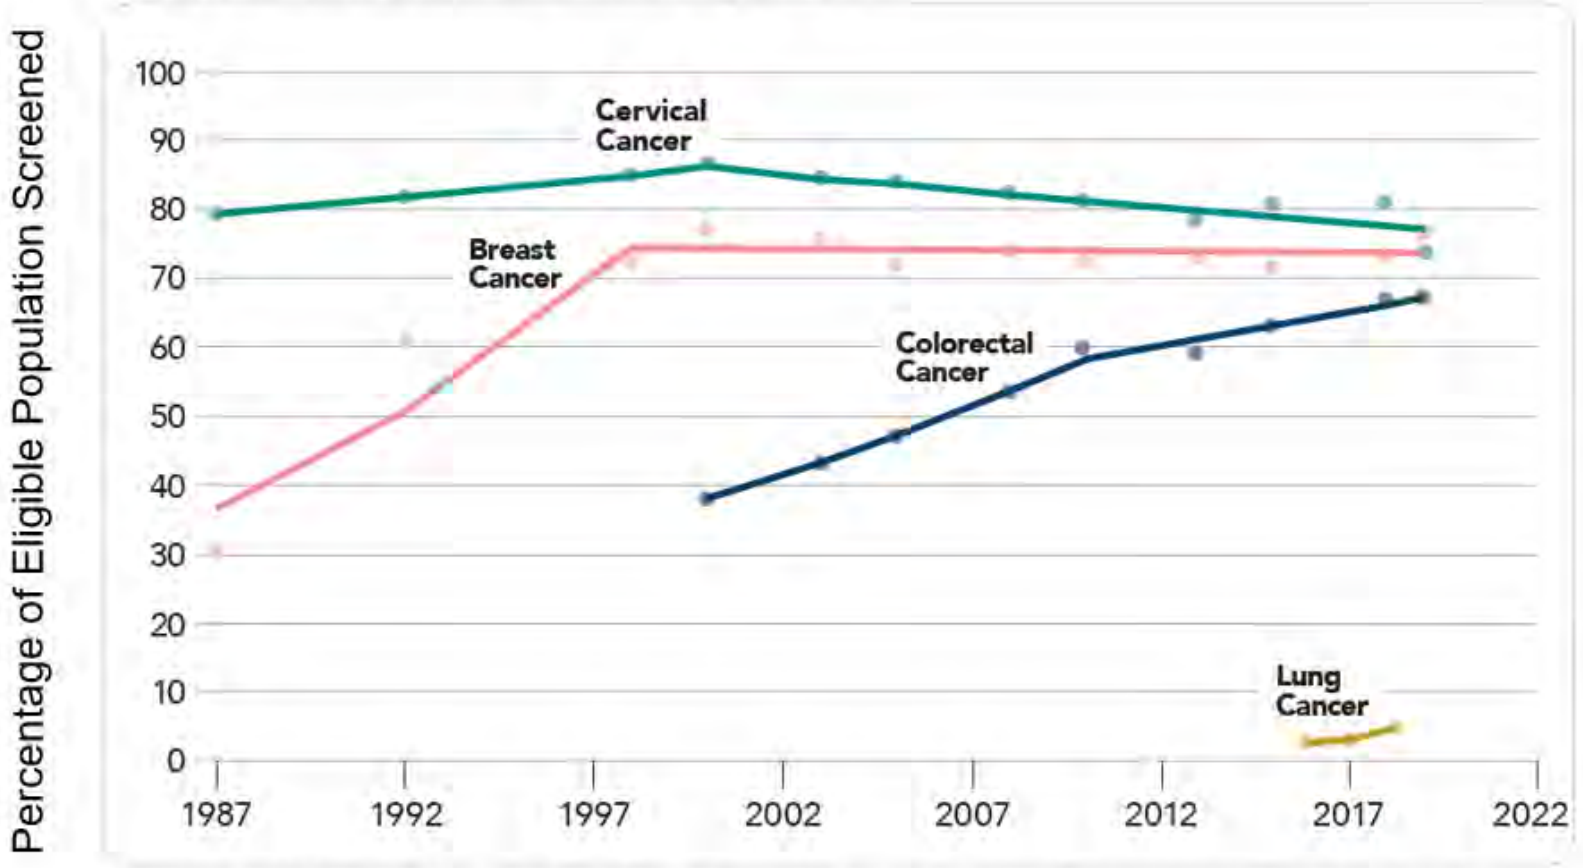
## USPSTF New Recommendations

- **New criteria would increase the relative percentage of persons eligible for screening by 87% overall**
  - 78% in White adults, 107% Black adults, and 112% in Hispanic adults compared with 2013 USPSTF criteria.
- **Increase the relative percentage of persons eligible for screening by 80% in men and by 96% in women.**

Agency for Healthcare Research and Quality; 2021.
AHRQ publication 20-05266-EF-2.

# Lung Cancer Screening

**Figure 1.** U.S. Cancer Screening Rates



Sources: National Cancer Institute. Available from http://progressreport.cancer.gov.
& Fedewa SA et al. J Natl Cancer Inst. 2021;113(8):1044-52. Figure by Chen M.

# National Failure

- **ALA survey of over 1,000 people eligible for LCS, only 15% aware that LCS is an essential health benefit and covered by most healthcare plans with no or minimal costs.**
- **The top reason why not screened their doctor never recommended it.**
- **3% of women cited lung cancer as a relevant health issue.**

https://www.lung.org/our-initiatives/lung-force/lung-health-barometer

## National Failure: Patient Communication

- Rates of Physician-Patient Discussions About Lung Cancer Screening **Very Low and Declining** (American Association for Cancer Research)
  - Prevalence of physician-patient discussions about lung cancer screening

**In 2012**

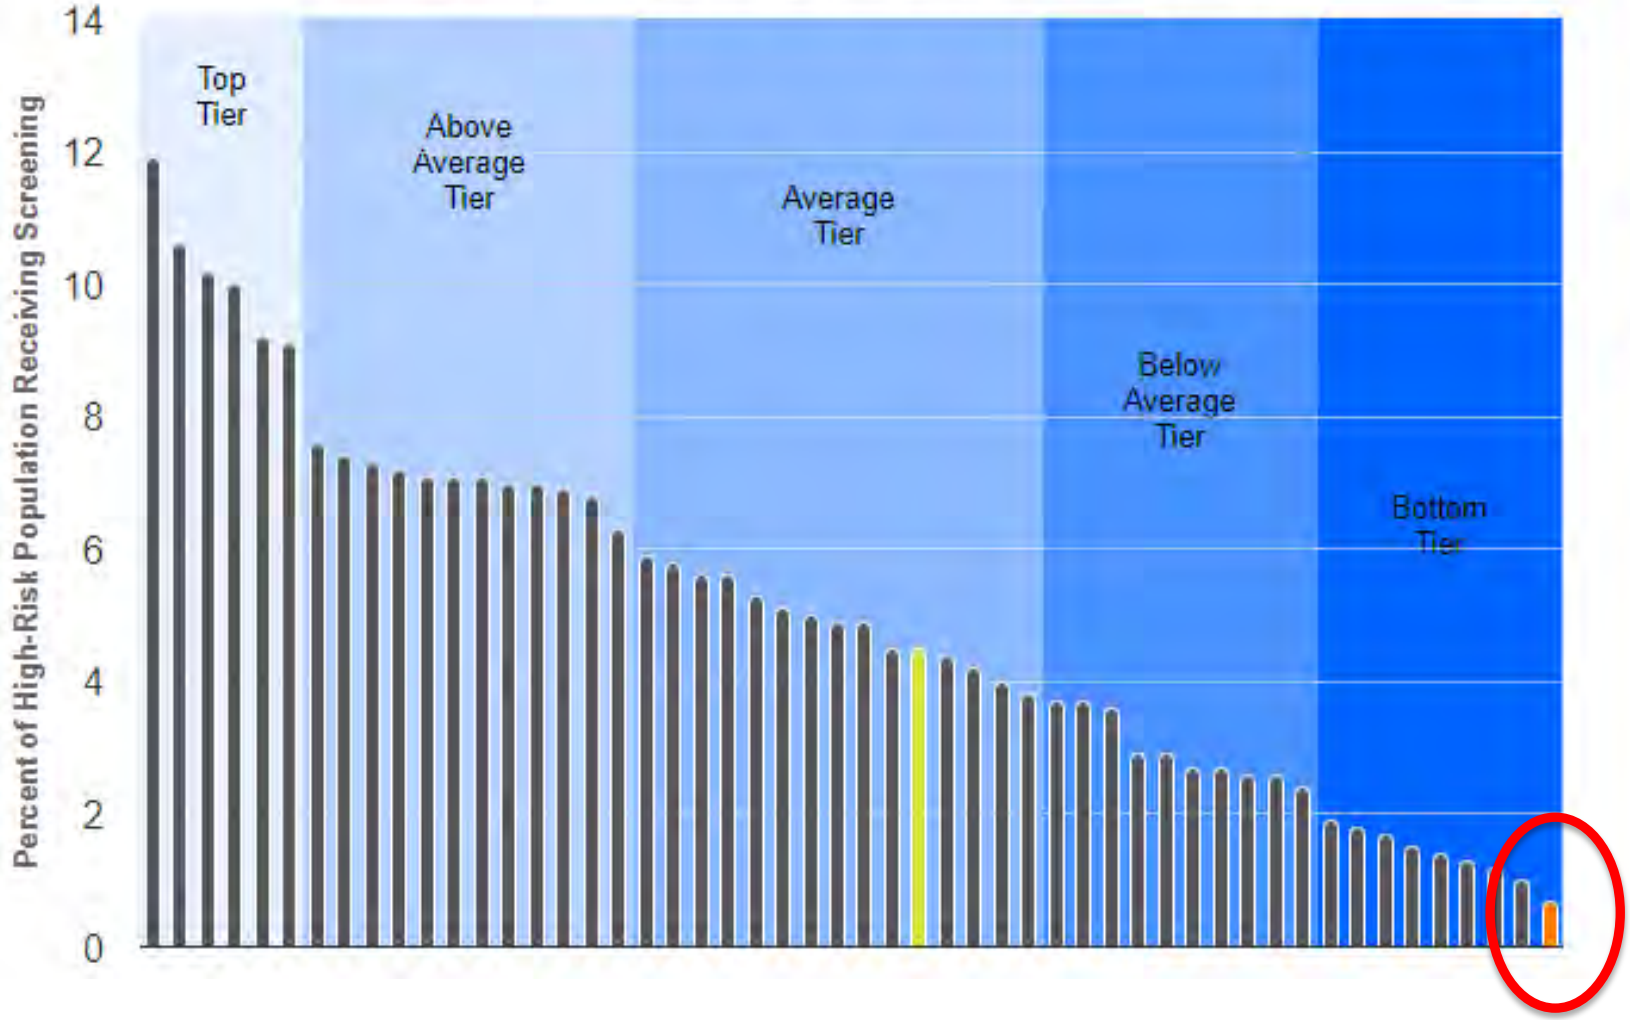
- 6.7% in the general population
- 12% among current smokers

**In 2017**

- 4.3% in the general population
- 8.7% among current smokers

American Lung Association
State of Lung Cancer
2023

## State Ranking by High-Risk Screening Rate



### Screening for High Risk:

- In California, **0.7%** of those at high risk were screened, which was **significantly lower** than the national rate of 4.5%.
- It ranks **51st** among all states, placing it in the **bottom tier**.
- Actual screening rates may be higher in states with large, regional managed care providers that did not share screening data.

HEDIS

# New Measure Coming for Lung Cancer Screening

November 15, 2022 · Andy Reynolds

**Description:** The Healthcare Effectiveness Data and Information Set (HEDIS) is a tool used by more than 90 percent of U.S. health plans to measure performance on important dimensions of care and service. More than 190 million people are enrolled in health plans that report quality results using HEDIS. Since 2008, HEDIS has also been available for use by medical providers and practices. Because so many health plans use HEDIS and because the measures are so specifically defined, HEDIS can be used to make comparisons among plans. To ensure that HEDIS stays current, the National Committee for Quality Assurance (NCQA) has established a process to evolve the measurement set each year through its Committee on Performance Measurement.

HEDIS

# New Measure Coming for Lung Cancer Screening

November 15, 2022 · Andy Reynolds

## Targeted Approach with Quality Goals

NCQA will look at how routine information shared in health encounters can help identify individuals who should get a lung cancer screening. Once implemented, this measure will help payers and providers steer a greater number of high-risk patents to lung cancer screenings, facilitate early detection, and ultimately reduce the number of deaths attributed to lung cancer.

We expect to develop the measure by the end of 2024.

UC DAVIS HEALTH UC Davis Health Lung Cancer Initiative

## HELP US BETTER UNDERSTAND, PREVENT, AND TREAT LUNG CANCER IN AFRICAN AMERICANS

David Tom Cooke, M.D., F.A.C.S.

David Cooke is the head of General Thoracic Surgery and an educator on lung cancer at UC Davis Health.

*"African Americans are diagnosed with and die from lung cancer more than any other demographic group in the United States. But that does not have to be the case. We have resources to eliminate those disparities!"*

UC DAVIS HEALTH Clinical and Translational Science Center

The CTSC at UC Davis has teamed up with the Lung Cancer Initiative to support lung cancer awareness and highlight research study oppoprtunities.

To see more information about Lung Cancer clinical research studies at UC Davis, visit https://studypages.com/ucdavis and search for "lung cancer".

## RISK

African Americans are more likely to get lung cancer, and more likely to die from it. African American men especially have an increased risk, and are 37 percent more likely to develop lung cancer despite a low overall exposure to cigarette smoke, the primary risk factor for lung cancer. But research tells us that if African Americans get screened and their disease is detected early, they have an equal chance at survival as other patients.

## LUNG CANCER SCREENING

Lung cancer screening with low-dose CT scanning for people at high risk was proven to be effective in 2011, and saves lives. Yet, of the more than 7.6 million Americans eligible for screening, only 2 percent have been screened. Most Americans don't know that lung cancer screening is covered by most health care plans, Medicare and Medi-Cal with minimal or zero costs.

The problem is that most doctors aren't recommending it. And like mammography for breast cancer, the eligibility criteria for lung cancer screening is well established. Any adult 55 to 80 who has a 30 pack-year history of smoking (equal to the number of packs smoked per day multiplied by the number of years smoked) and either smokes currently or has quit within the past 15 years is eligible.

Lung cancer screening is a game changer. Most lung cancers detected by the scan are stages I or II with the highest rate of cure, especially today with advanced treatments like minimally invasive surgery and targeted and immunotherapies.

Screening is easy, too. Low-dose CT is a special X-ray. A patient's doctor will order the scan after discussing the risks and benefits of the exam. It takes no more than 10 minutes. There are no needles involved. A radiologist reviews the scan and sends the results back to the doctor who ordered it. The patient typically learns the results within a few days. Lung cancer screening is accessible at UC Davis Health as part of our Comprehensive Lung Cancer Screening Program.

To see more information about lung cancer screening visit https://health.ucdavis.edu/surgery/specialties/cardio/lung_cancer_screen.html

## ALL YOU NEED TO GET LUNG CANCER ARE LUNGS

Although 80% of lung cancers are caused by tobacco exposures, 20% is not. Researchers have examined smoking behavior, workplace exposures, genetics, acce to health care, discrimination and social stress, as well as other possible contributors. The answer appears to be that lung cancer is also caused by a mix of biological, environmental, sociodemographic factors, including asbestos and radon exposure, poor air quality and unmeasured genetic factors.

## LUNG CANCER RESEARCH AT UC DAVIS

UC Davis has several clinical trials for lung cancer patients available at any given time. Clinical trials, also known as "clinical research studies", or "clinical studies", are studies in human volunteers that try to answer specific health questions. Some clinical trials measure the safety and effectiveness of potential new treatments. Other clinical trials observe health issues and behaviors in large groups of people.

The importance of enrollment in clinical trials is not to be underestimated. Studies have found that patients who have participated in lung cancer clinical trials exhibited a cancer specific survival benefit. However, people of color, especially African Americans are less likely to participate in lung cancer clinical trials.

## Addressing Disparities in Lung Cancer Screening

November 24, 2020
Kristie L. Kahl

# Outreach Works!

**From:** [redacted]
**Sent:** Thursday, December 17, 2020 7:52 AM
**To:** Thoracic Surgery <thoracic@UCDAVIS.EDU>
**Subject:** Dr Cooke's article in Cure Magazine..

Hi Dr. Cooke,
As an African American female lung cancer survivor, I wanted to thank you for your article in Cure. I found it really informative and wish I had seen it before I was diagnosed. I'm actually one of the lucky ones. I saw the American Lung Association billboard on the side of Highway 880 as I drove home to Fremont from my job in San Jose. I'll always say that billboard saved my life because it made me aware of such a thing as a low dose CT scan. Being stuck in traffic, I read that early detection is important.

I won't go into how my PCP refused to order the test at first because she concluded that I "didn't meet the criteria". Suffice it to say " I persisted" and it saved my life. Although your interview was good, as a patient, I wish more doctors would mention that fear and stigma are just as much a barrier to getting screened and treated as a compromised health care system. I think we have to get people to realize and understand that early detection is key. Thank you for everything that you do.
—

ADVANCING HIGH VALUE HEALTH CARE

THE AMERICAN JOURNAL of MEDICINE®

## Electronic Population Health Tools Enhance Preventive Care for Older Adults

Eric W. Chak, MD, MPH,[a] Elizabeth Cortez-Toledo, MA,[a] Randy Luna, BS,[b] Scott MacDonald, MD,[b] Susan L. Stewart, PhD,[c] David T. Cooke, MD,[d] Moon S. Chen Jr., PhD, MPH[e]

Title: Enhancing Electronic Health Systems to Decrease the Burden of Colon Cancer, Lung Cancer, Obesity, Vaccine-Preventable Illness, and Liver Cancer (CLOVER)
Project: GRANT12965631 (Chak)
Agency: National Institutes of Health

| CLOVER Parameter | Outcome Measure | #At-Risk | Baseline Adherence (Prior to August 2020) | CLOVER Adherence (August 2020-May 2021) | Relative Change |
|---|---|---|---|---|---|
| Lung Cancer | CT Lung Completion | 280 | 6% | 18.9% | 315% |

# Direct Patient Contact

**Dr. Chak's CLOVER Lung Screening component**

- Scott MacDonald's team (Randy Luna) created custom Epic Workbench report
- Report contains all Smokers at Carmichael, for example, with upcoming appointments
- Staff member (Pre-visit planner-PVP) reaches out to patients with upcoming appointments with PCP (1-2 weeks in advance) to discuss and verify smoking History prior to upcoming appointment and updates smoking Hx in Epic
- Report is not granular enough to meet all the specific requirements to identify if the patient meets screening criteria and reason for staff needing to call pt to identify missing information.
- Once the staff member speaks to patient and verifies correct history and they meet criteria they are scheduled to either have a phone call by Dr. Chak or sent to the Cancer center Lung Ca screening staff for counselling/informational session
- If patient agrees to screening Dr. Chak places CT order. The PVP follows up to make sure the CT is completed, acts as a patient navigator.
- Results go to PCP and ordering provider
- Results are followed up—PCP always involved—

**Eric W Chak**
I'll add here that it is the smoking history in the EHR that is usually inaccurate. It is not regularly updated so we are trying to update/correct it to ensure that are truly LCS candidates.

**Eric W Chak**
The results go to the ordering provider (may not be PCP), but we always forward result to PCP to keep them in the loop.

# Strategic pillars

- Develop a Regional System of Care
- Deliver Exceptional Patient and Care Team Experiences
- Advance Health Equity and Address Disparities
- **Develop and Grow Integrated, Patient-Centric Service Lines**

# What is an Integrated Service Line?

- An Integrated Service Line (ISL) is the organization of **multidisciplinary clinical programs** into an integrated **care continuum around a population or disease state**.

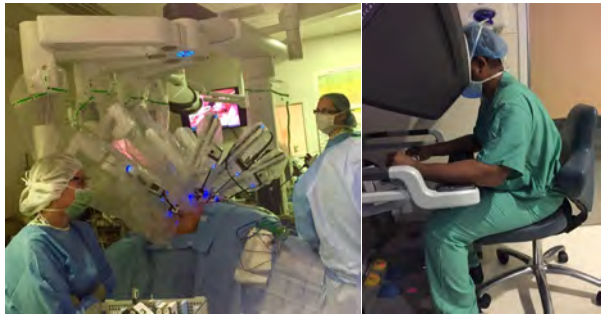
- Service lines reach beyond the traditional departmental structure in that the **accountability and responsibility for optimizing clinical services**, non-clinical operations, and capital and operational budgets reside with service line leadership (may be matrixed with clinical departments and operations).

# Why Build a Patient-Centered Service Line?

- A service line structure is intended to provide a more **integrated and focused patient experience** while contributing to clinical efficiencies, clinical research, performance improvement, and expansion and integration of clinical areas with high market demand.

# UC Davis Health &
# Lung Cancer Integrated Service Line
## Trust – Simple - Peace of Mind

James gets a lung cancer screening CT and finds an early staged lung cancer.



Charles' incidental lung cancer is diagnosed at an early stage and cured.

Linda and her family are happy with the speed of her diagnosis & ease of her care. They want to give back to UC Davis.

Sarah's doctor is amazed how fast her referrals get into UC Davis.

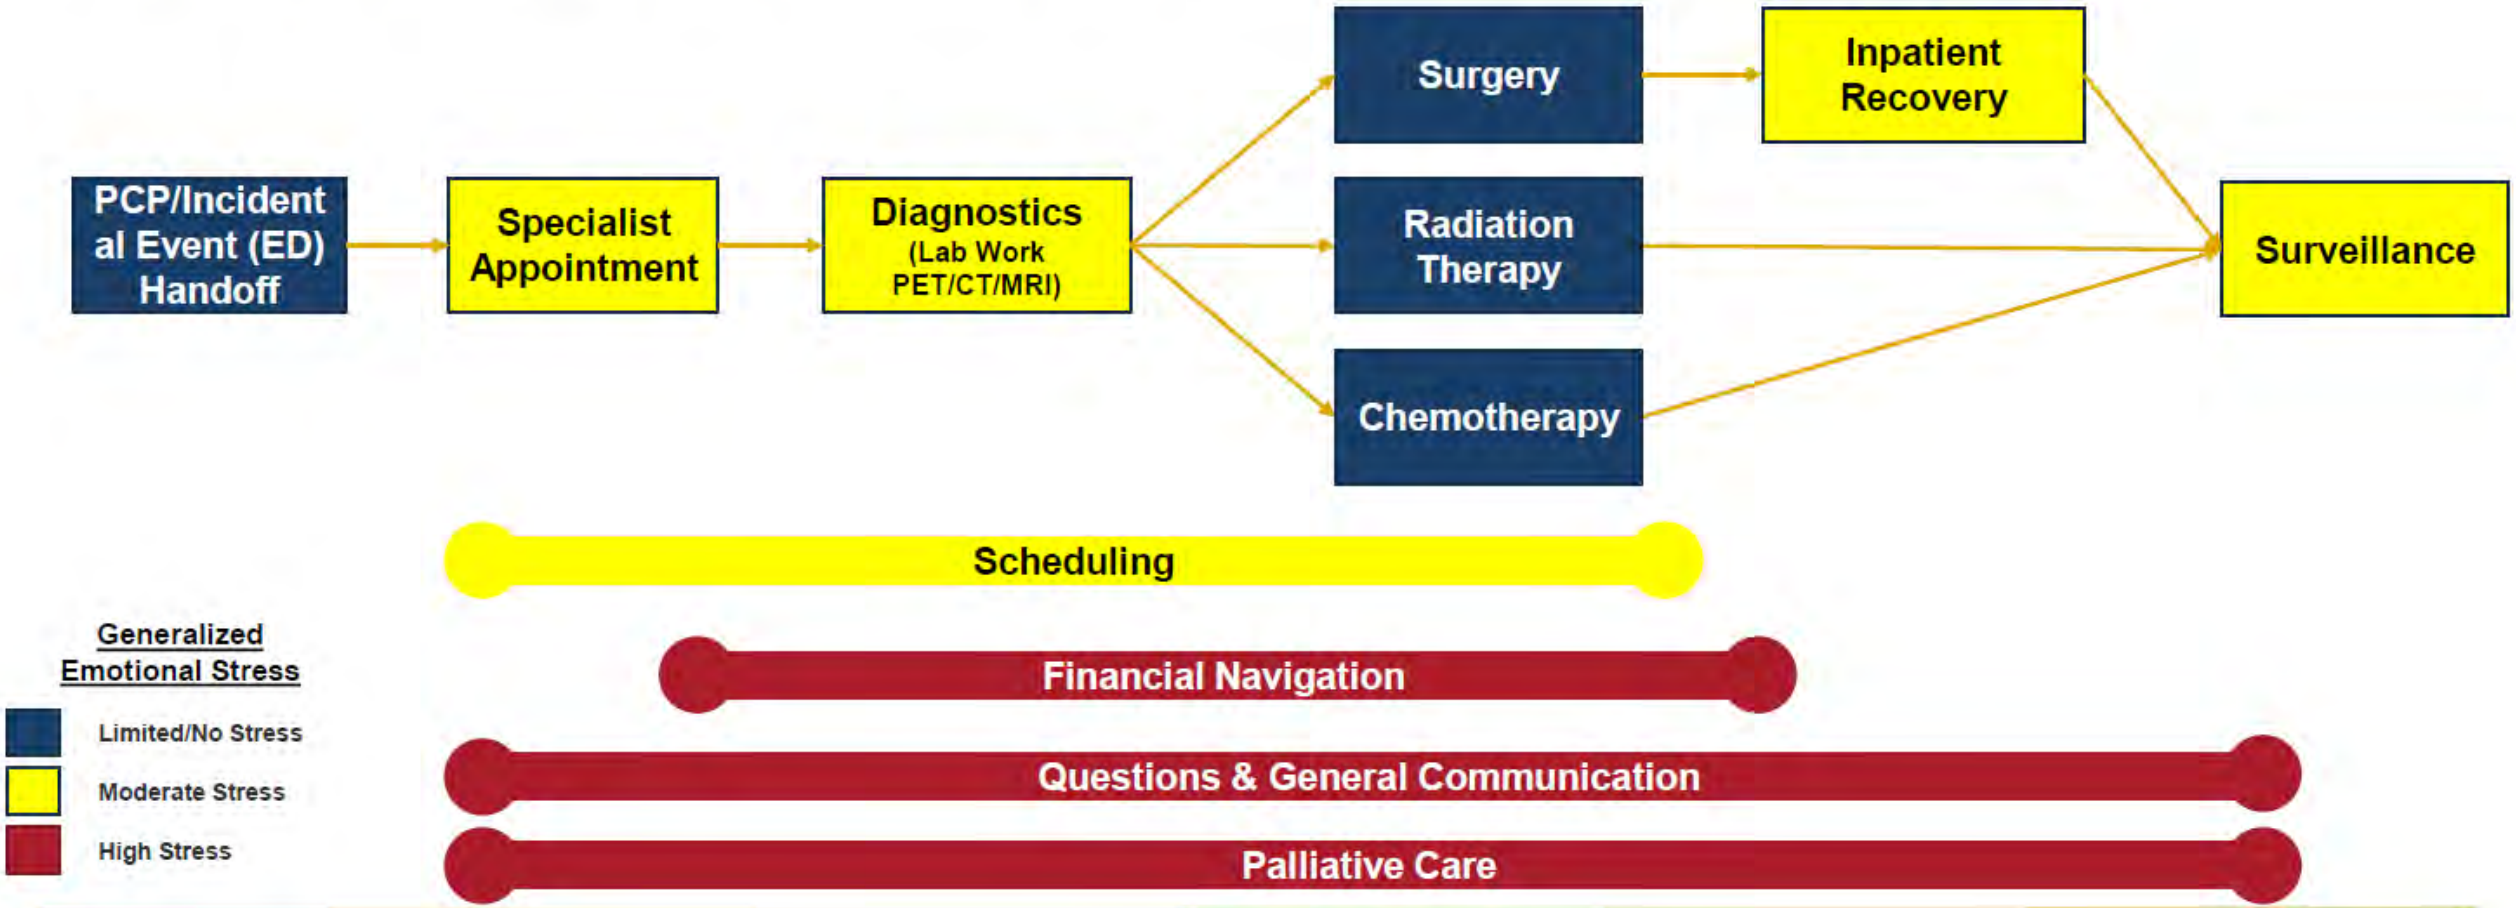
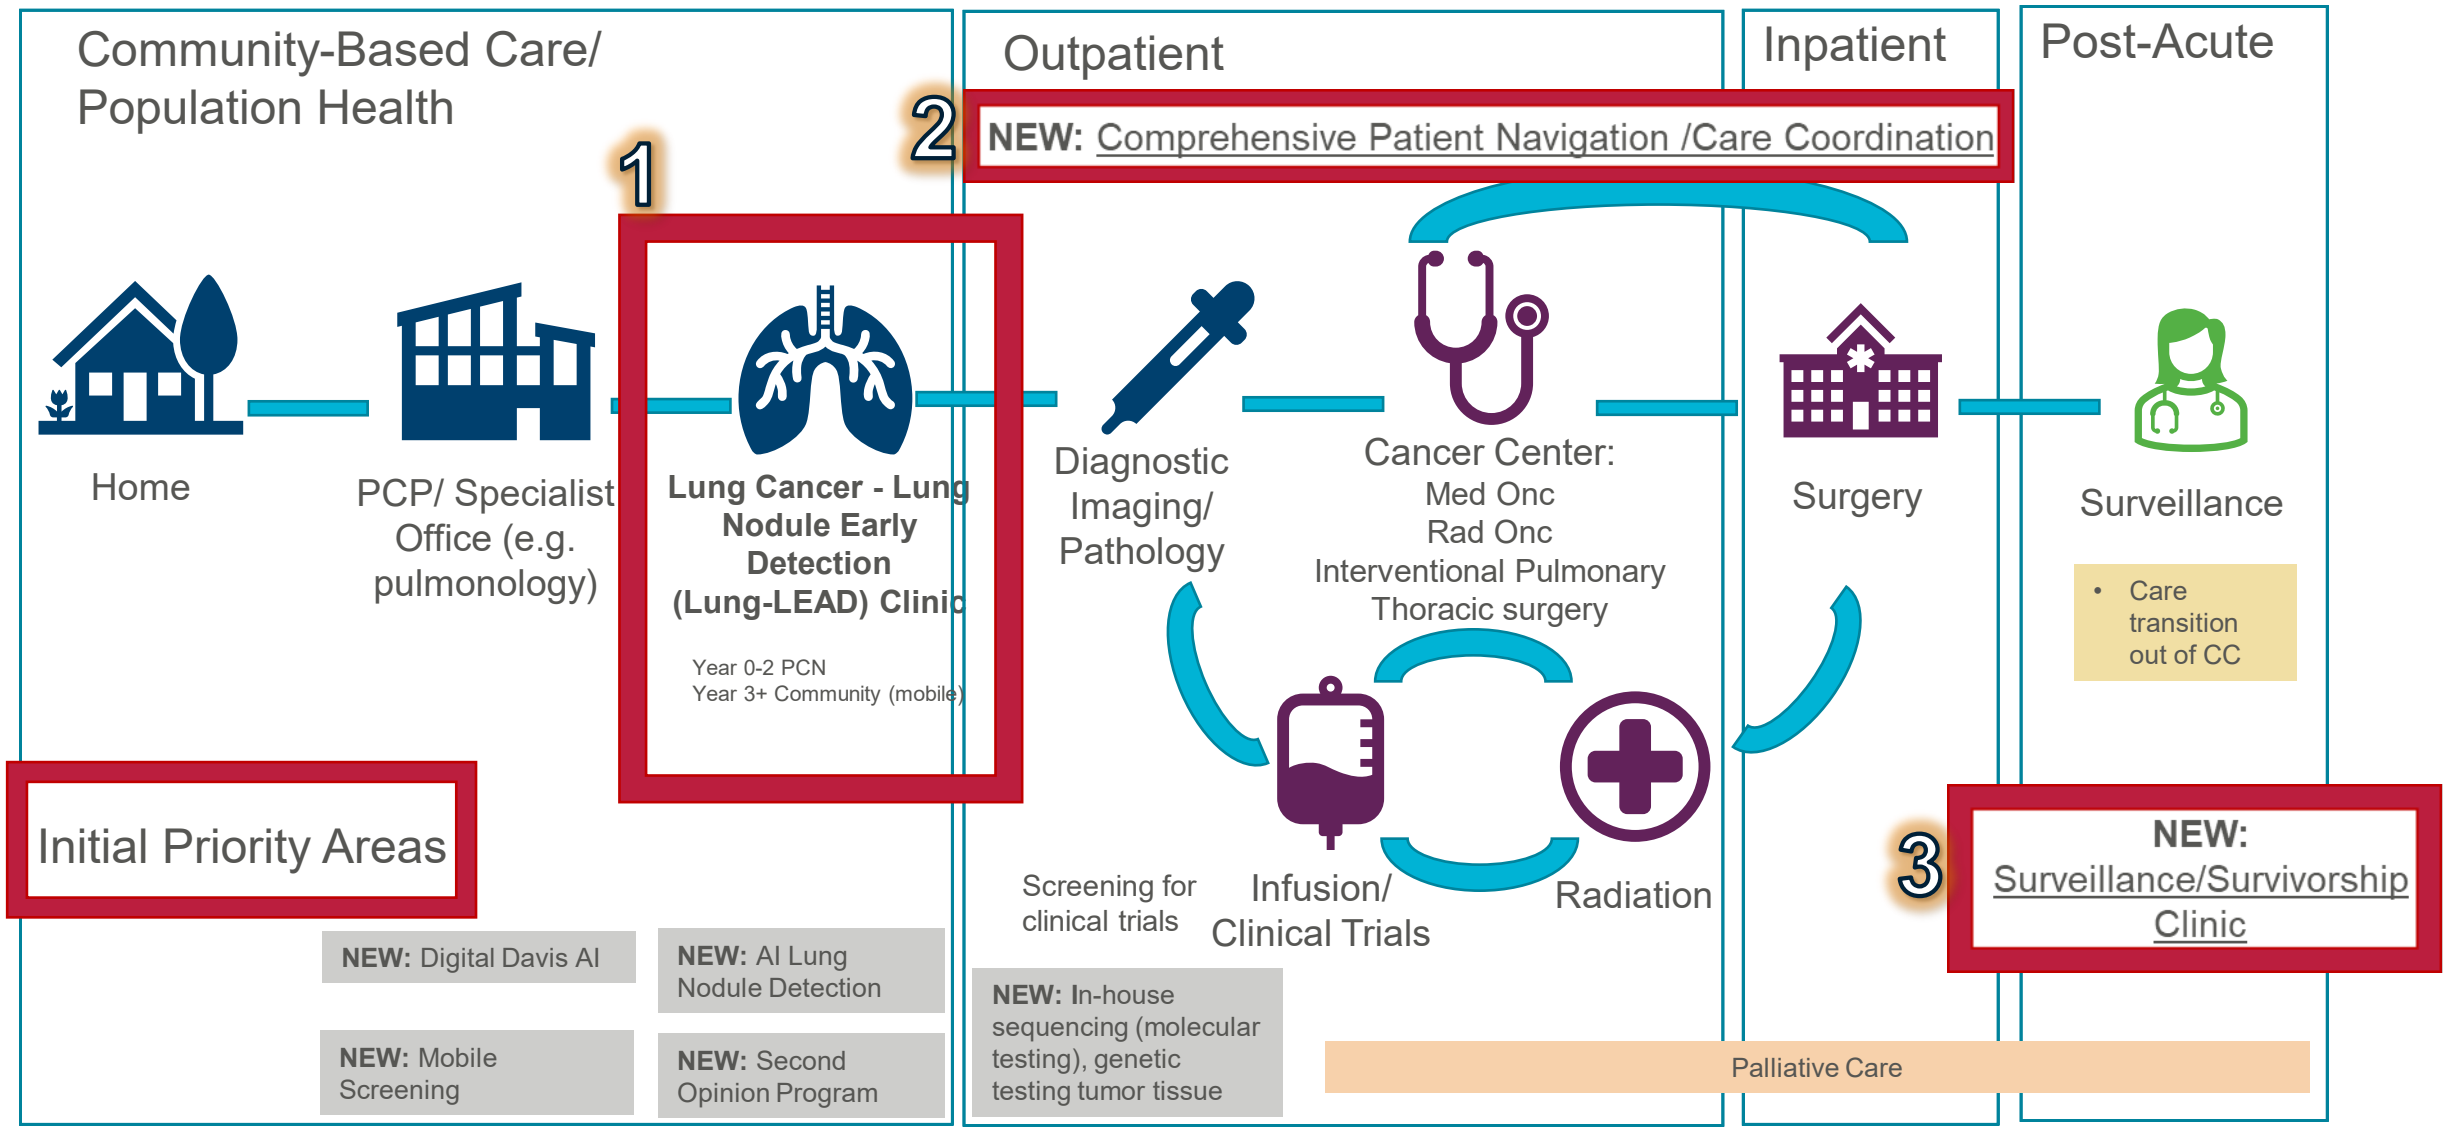
# Top-Level Areas of Friction

**This visual is designed to highlight areas of fiction patients faced in their experiences. These colors correspond to report details and highlight areas of emotional stress specific to their experiences.**



# Lung Cancer ISL Care Continuum



# Initial Priority Areas

1. Community-Based Care/Population Health
   - Lung Cancer - Lung Nodule Early Detection (Lung-LEAD) Clinic

     Increase the LDCT screening rate of patients, centralize management of incidental lung nodules, encourage active surveillance of LDCT screening patients and incidental findings, improve upon smoking cessation efforts.

2. Outpatient
   - Comprehensive Patient Navigation – Care Coordination

     Align and expedite testing and results to ensure meaningful treating provider and accelerated path from new patient referral, initiation of treatment, and navigation of care. Focused on patients **diagnosed** with lung cancer, and patients **highly suspected of having** lung cancer.

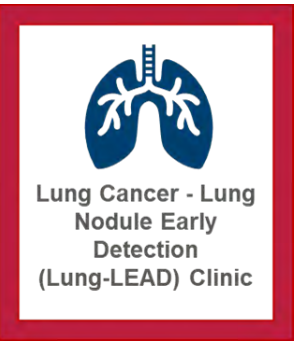
3. Post-Acute
   - Surveillance/Survivorship Clinic

     Transition long-term follow-up/surveillance patients from the treating provider schedule to APP, opening provider template to new patient appointments and expand access to the Cancer Center.

# Lung Cancer - Lung Nodule Early Detection (Lung-LEAD) Clinic

1

1. Patient Review Criteria
   - Established patients with an upcoming PCP appointment with UCDH will be flagged for review if they are aged 50-80 (77 Medicare) and have a history of smoking (as reported in EPIC)
2. Dedicated Lung Cancer ISL Care Navigators
   - Our Lung Cancer ISL Care Navigators will proactively engage with patients to update smoking history, determine patients for lung cancer screening eligibility (age, pack year history, current smoker/quit date), and schedule appointments with the Lung ISL APP in the Lung Early Detection Clinic.



3. Dedicated Lung Cancer ISL APPs
   - The Lung Cancer ISL APP will conduct a shared-decision making (SDM) visit and order a Low Dose CT (LDCT) for eligible patients who want to proceed with screening.
   - The Lung Cancer ISL APP will complete a follow-up visit with all patients to communicate results, ongoing follow-up (immediate or annual), and will order additional tests / referrals as needed based standardized clinical criteria
4. Communication and Results
   - The patient's primary care physician will be cc'd on the Lung Cancer ISL APP provider chart note if the patient meets with the Lung Cancer ISL APP
   - If the LDCT shows significant screening results, these will be directly communicated to the patient's primary care physician

# Workflow: Lung - LEAD Clinic (Comprehensive Lung Cancer Screening Program)

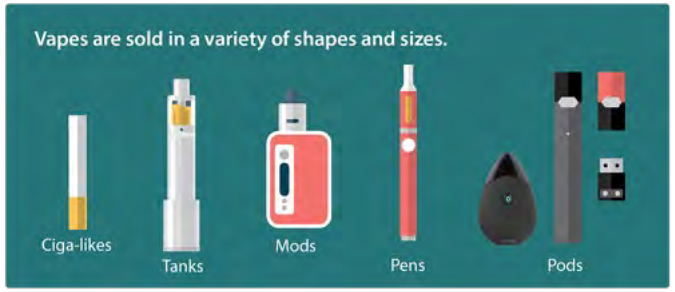
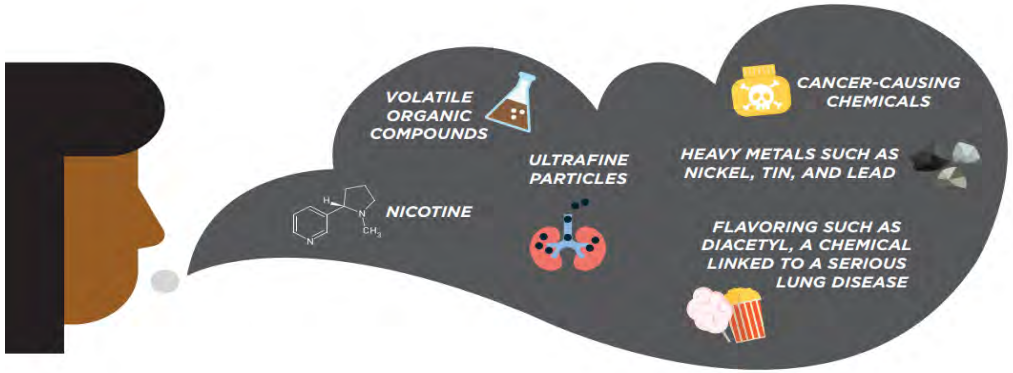
# NEW PRODUCTS, NEW PROBLEMS



## New Nicotine Salts

Nicotine salts, which have a lower pH than free base nicotine, allow particularly high levels of nicotine to be inhaled more easily and with less irritation to the throat than freebase nicotine.

THE E-CIGARETTE AEROSOL THAT USERS BREATHE FROM THE DEVICE AND EXHALE CAN CONTAIN HARMFUL AND POTENTIALLY HARMFUL SUBSTANCES:



It is difficult for consumers to know what e-cigarette products contain. For example, some e-cigarettes marketed as containing zero percent nicotine have been found to contain nicotine.

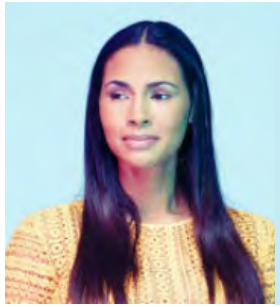
# TOBACCO USE = A HEALTH EQUITY ISSUE

## African American/Black

There are up to 10 times more tobacco ads in **African American/Black** neighborhoods than in others.



## American Indian

The tobacco industry appropriates **American Indian** cultures in marketing, using valued traditions to promote tobacco use.

## Hispanic/Latino

Big Tobacco gave $75,000 to the **Hispanic American** Chamber of Commerce to mail 92,000 letters urging businesses to protest tobacco tax increases.

## Asian/Pacific Islander

A Tobacco executive stated that **Asian American** populations would be a profitable target due to "this community being generally predisposed toward smoking."

## Low-income

Big Tobacco targeted children living **in low-income** housing projects by handing our free packs of cigarettes in the 50s.

## LGBTQ

In 1995, a tobacco company created a targeted marketing plan for **Lesbian, Gay, Bisexual, Transgender, Queer (LGBTQ) communities** called "Project SCUM".

## People with Mental Challenges

Big Tobacco promoted cigarettes as a medicinal substance in **behavioral** health treatment facilities.

## Rural Communities

Big Tobacco warps rural masculine ideals by depicting rugged images of cowboys, hunters, and racecar drivers in their advertising, making people living in **rural communities** some of Big Tobacco's best customers.

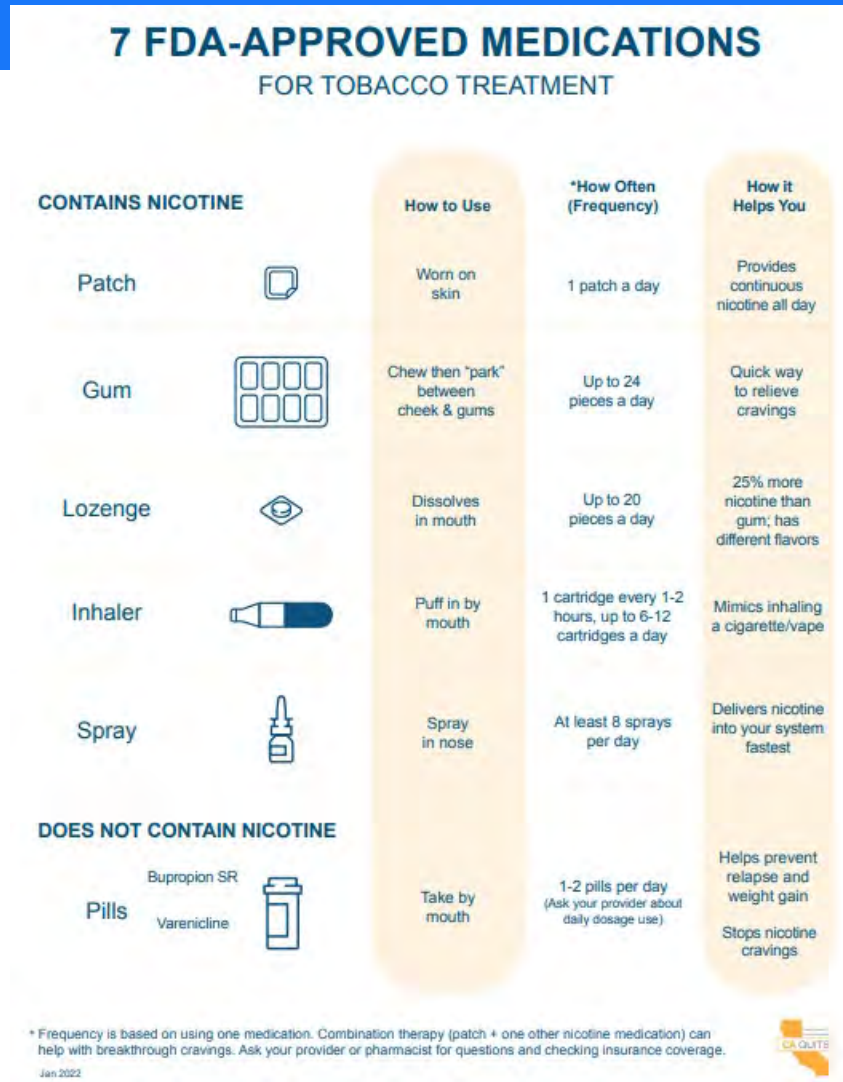
# **ASSIST:** CESSATION MEDICATIONS



## 7 FDA-APPROVED MEDICATIONS
FOR TOBACCO TREATMENT

| | How to Use | *How Often (Frequency) | How it Helps You |
|---|---|---|---|
| **CONTAINS NICOTINE** | | | |
| Patch | Worn on skin | 1 patch a day | Provides continuous nicotine all day |
| Gum | Chew then "park" between cheek & gums | Up to 24 pieces a day | Quick way to relieve cravings |
| Lozenge | Dissolves in mouth | Up to 20 pieces a day | 25% more nicotine than gum; has different flavors |
| Inhaler | Puff in by mouth | 1 cartridge every 1-2 hours, up to 6-12 cartridges a day | Mimics inhaling a cigarette/vape |
| Spray | Spray in nose | At least 8 sprays per day | Delivers nicotine into your system fastest |
| **DOES NOT CONTAIN NICOTINE** | | | |
| Pills: Bupropion SR, Varenicline | Take by mouth | 1-2 pills per day (Ask your provider about daily dosage use) | Helps prevent relapse and weight gain<br>Stops nicotine cravings |

* Frequency is based on using one medication. Combination therapy (patch + one other nicotine medication) can help with breakthrough cravings. Ask your provider or pharmacist for questions and checking insurance coverage.

THE SACRAMENTO BEE

VIEWPOINTS

*To save African American lives, flavored tobacco ban must include menthol cigarettes*

BY DAVID TOM COOKE AND PHILLIP GARDINER *SPECIAL TO THE SACRAMENTO BEE*
UPDATED MARCH 14, 2019 12:15 PM

PUBLIC HEALTH

Join the Fight Against Underage Vaping

"No, I don't smoke, I just vape." For pediatricians, this response is all too familiar from our adolescent patients during routine health maintenance visits.

We are currently in an epidemic of teen vaping, with as many as one in five teens saying they have used e-cigarettes. The 2019-2020 California Student Tobacco Survey revealed 96% of high schoolers in California who vape use flavored vape products. Candy-flavored tobacco and nicotine products can lead to addiction and hook customers for a lifetime.

E-cigarette use in teens can have significant detrimental effects to their health, prime the developing brain for future addiction and increase the likelihood that they will use traditional cigarettes later in life. Ninety percent of adult smokers smoked their first cigarette before the age of 18, and more than one half of young adults who smoke daily started smoking between ages 6 to 12.

Fruit and candy flavors like bubble gum, blue raspberry and root beer have been used in vape pens and electronic cigarettes, making them more attractive to underage users. Colorful and convenient packaging work to glamorize nicotine use. Moreover, while flavorings may seem innocuous, some flavoring chemicals have been found to be toxic and damage lungs.

As many as one in five teens say they have used e-cigarettes. Some flavoring chemicals have been found to be toxic and damage lungs.

Menthol is a common flavor that makes it easier to start, harder to quit and increases the risk of harm. Big Tobacco's years of targeted marketing has resulted in significant health disparities for African Americans and many other groups. The U.S. Food and Drug Administration's recent ruling to take menthol out of cigarettes has been years overdue.

What's even worse is these new products with nicotine salts, which are more bioabsorbable and can contain as much nicotine as a pack of 20 cigarettes, amplifying the opportunity for addiction and disease. Vaping is associated with up to a seven-fold increase in getting COVID. New disease epidemics like EVALI are still sidelining young people locally during COVID.

How do we keep these dangerous products out of the hands of children? Limiting the retail sale of flavored tobacco products is one first step to reduce access. Addiction among children and young adults will decrease when tobacco tastes and smells like tobacco. A study of children and young adults in Texas in 2017 revealed 75% of flavored tobacco users reported they would no longer use the product if it wasn't flavored.

California has a state law restricting the sale of flavored tobacco products, including menthol, but it has been on hold. In August 2020, California passed Senate Bill 793, with bipartisan support, to prohibit the sale of flavored tobacco products. The tobacco industry spent over $20 million to place a referendum on SB 793, and the law's implementation has been on hold pending the outcome of a vote by Californians on the November 2022 ballot.

At the local level, over 125 cities and counties in California have passed restrictions on the sale of flavored tobacco products. The City of Sacramento has had a policy since 2020 and unincorporated Sacramento County will implement a similar policy in July 2022. Several other cities in the Sacramento region have been actively considering policies.

Local physicians who work at UC Davis Health have joined public health groups to help educate policymakers and the community. The Sacramento Sierra Valley Medical Society and its Public and Environmental Health Committee have helped with local education and support, consistent with the California Medical Association's official position.

There are several ways for SSVMS physicians to get involved and make a difference. One way to become more active in the campaign is to contact the Greater Sacramento Smoke & Tobacco Free Coalition at greatersactfcoalition@gmail.com or call (916) 879-5869 about opportunities to join upcoming policy meetings and a speakers' bureau training.

Patients who smoke or vape can be referred to Kick It California (www.kickitca.org), previously the California Smokers' Helpline, for free help to quit. The 2% Quits series also offers free, brief tobacco treatment training modules worth up to 3.0 CME credits at www.cmecalifornia.com. More information can be found at the California Tobacco Control Program's public website at www.cctcp.org.

When Big Tobacco wins, our children and communities lose. As physicians, we can help the next generation from suffering through more tobacco epidemics.

| Low risk† | No routine follow-up | CT at 3–6 months, then consider CT at 18–24 months | CT at 3–6 months, then consider CT at 18–24 months | Use most suspicious nodule as guide to management. Follow-up intervals may vary according to size and risk (recommendation 2A). |
| High risk† | Optional CT at 12 months | CT at 3–6 months, then at 18–24 months | CT at 3–6 months, then at 18–24 months | Use most suspicious nodule as guide to management. Follow-up intervals may vary according to size and risk (recommendation 2A). |

Note.—These recommendations do not apply to lung cancer screening, patients with immunosuppression, or patients with known primary cancer.

* Dimensions are average of long and short axes, rounded to the nearest millimeter.

† Consider all relevant risk factors (see Risk Factors).

# Question for Dr. Tong

- How does this patient’s smoking history change your approach to management?

# Question for Dr. Shaller

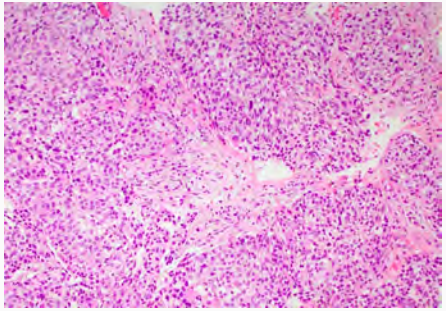
- Who does the biopsy – IR or IP?

# Question for Dr. Cooke

- When is empiric surgical resection appropriate for both diagnosis and treatment?

# Case 1 Outcome

- Patient received a CT guided biopsy of the LLL nodule and was found to have squamous cell carcinoma of the lung
- Lymph node biopsies did not show hilar or mediastinal disease
- Due to her comorbidities, surgery was not offered
- She is currently seeing radiation oncology with plans for definitive SBRT with Cyberknife

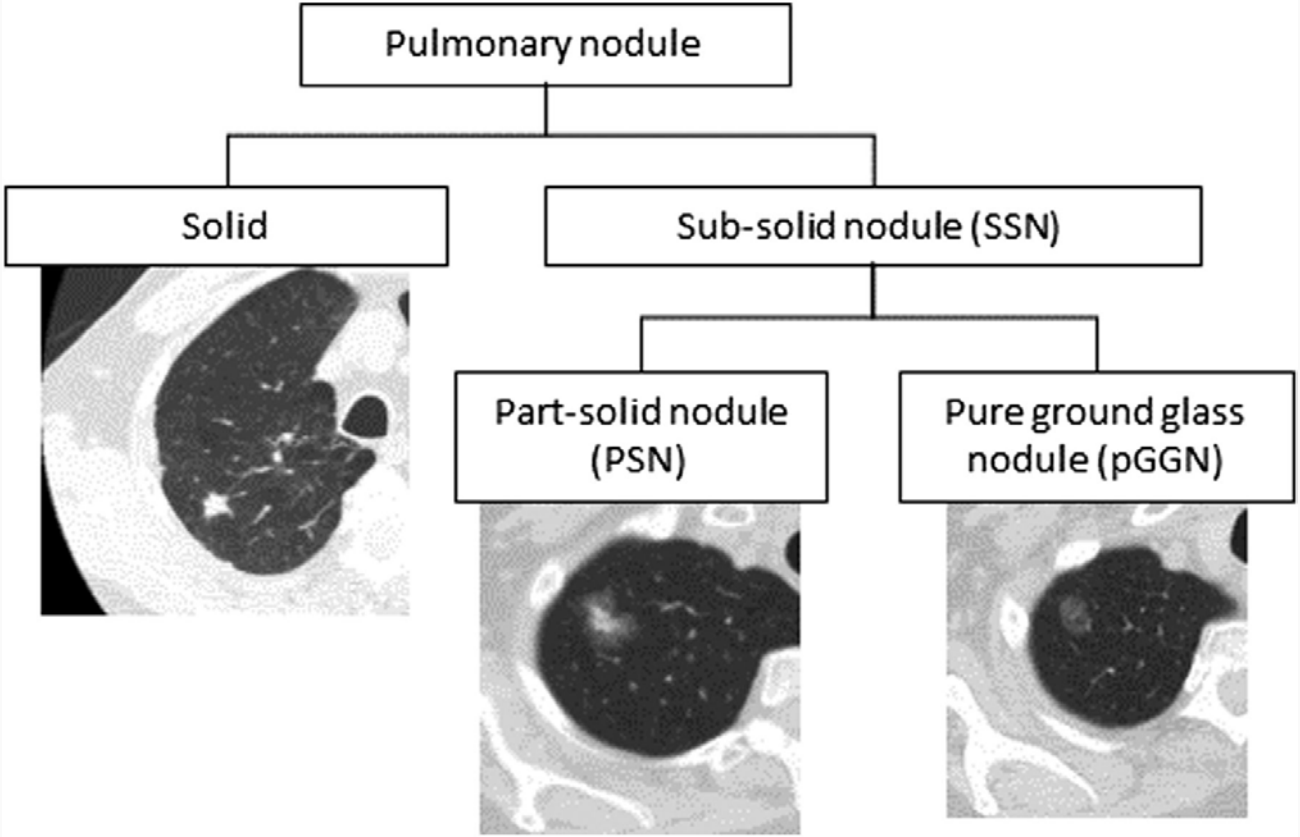


https://www.pathologyoutlines.com/topic/lungtumorscc.html

# Case 2

A 69 yo female with GOLD 1A COPD and 75 pack year smoking history has multiple subsolid lesions in her right lung. Her nodules were first detected on low dose CT in 2019 and have been slowly growing through 2023.

# Classification and CT Appearance of Pulmonary Nodules



https://doi.org/10.1136/thoraxjnl-2015-207221

# Fleischner Society 2017 Guidelines for Management of Incidentally Detected Pulmonary Nodules in Adults (*Radiology*)

**B: Subsolid Nodules***

| Nodule Type | Size | | Comments |
|---|---|---|---|
| | <6 mm (<100 $mm^3$) | ≥6 mm (>100 $mm^3$) | |
| Single | | | |
| Ground glass | No routine follow-up | CT at 6–12 months to confirm persistence, then CT every 2 years until 5 years | In certain suspicious nodules < 6 mm, consider follow-up at 2 and 4 years. If solid component(s) or growth develops, consider resection. (Recommendations 3A and 4A). |
| Part solid | No routine follow-up | CT at 3–6 months to confirm persistence. If unchanged and solid component remains <6 mm, annual CT should be performed for 5 years. | In practice, part-solid nodules cannot be defined as such until ≥6 mm, and nodules <6 mm do not usually require follow-up. Persistent part-solid nodules with solid components ≥6 mm should be considered highly suspicious (recommendations 4A-4C) |
| Multiple | CT at 3–6 months. If stable, consider CT at 2 and 4 years. | CT at 3–6 months. Subsequent management based on the most suspicious nodule(s). | Multiple <6 mm pure ground-glass nodules are usually benign, but consider follow-up in selected patients at high risk at 2 and 4 years (recommendation 5A). |

Note.—These recommendations do not apply to lung cancer screening, patients with immunosuppression, or patients with known primary cancer.

* Dimensions are average of long and short axes, rounded to the nearest millimeter.

† Consider all relevant risk factors (see Risk Factors).

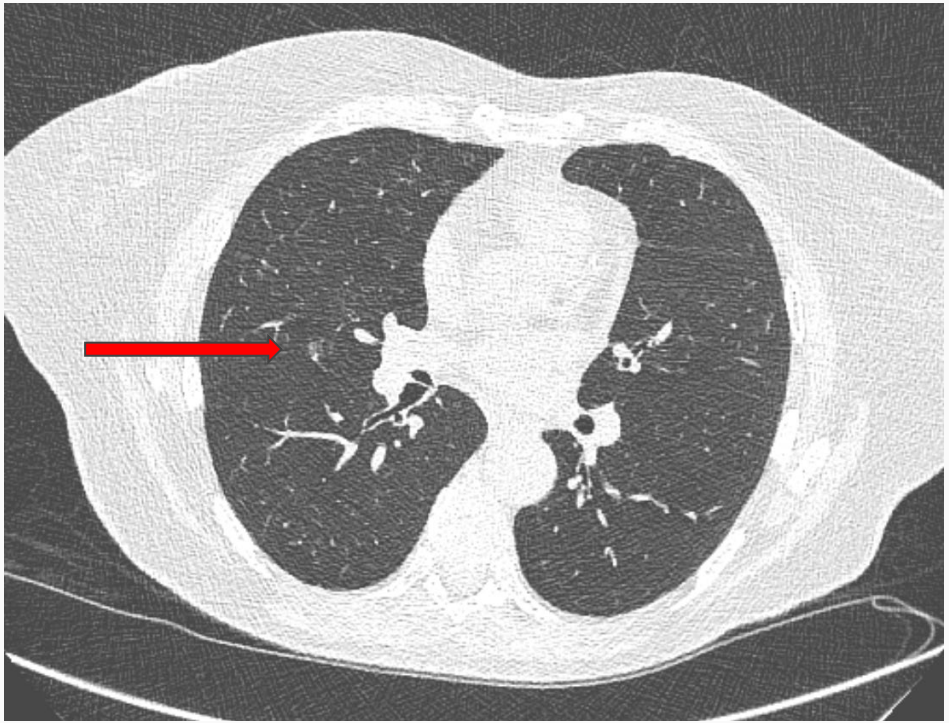
# Case 2

Nodules are measured as following:

- RLL anterior basal segment cystic ground glass nodule, 25 x 20 mm
- RLL superior segment subsolid nodule, 9 x 8 mm
- RML lateral segment subsolid nodule, 10 x 9 mm

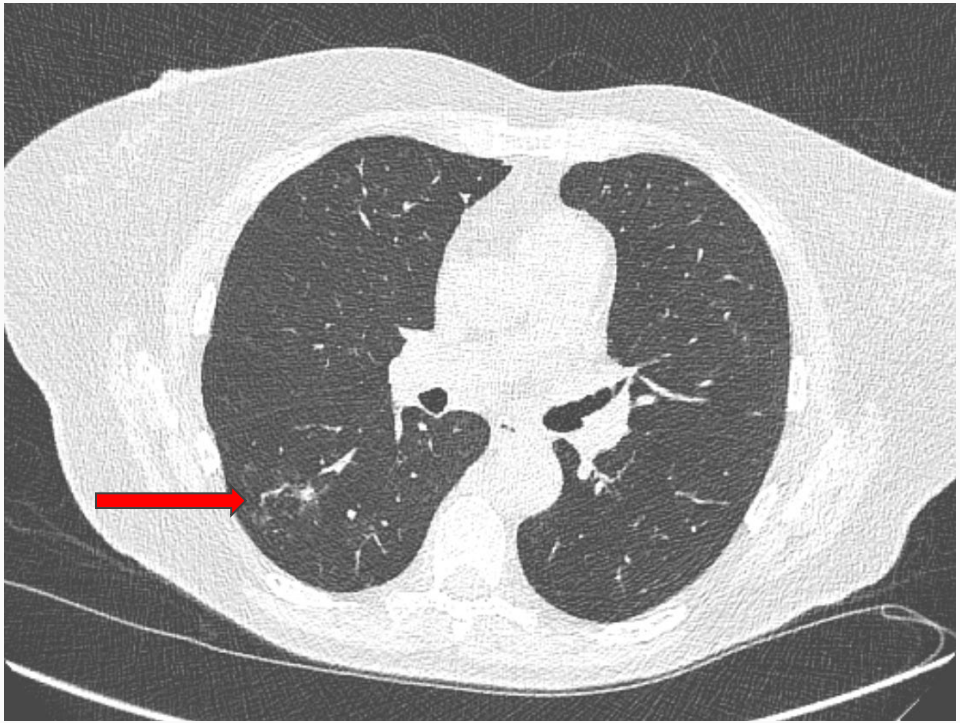
# Case 2 Imaging

- RML lateral segment subsolid nodule, 10 x 9 mm



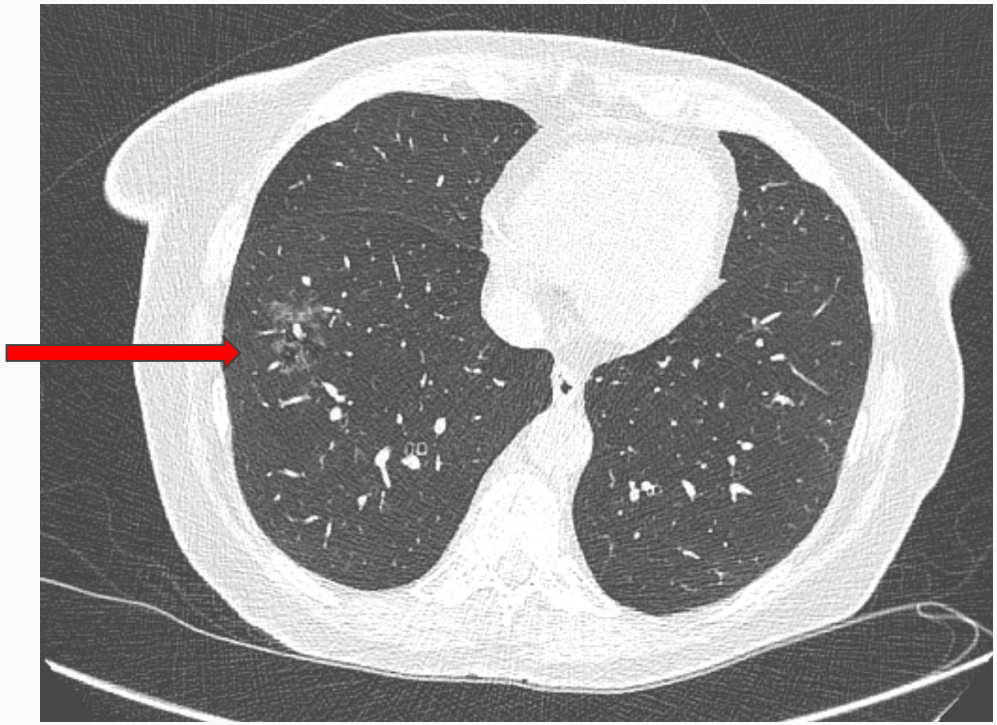
# Case 2 Imaging

- RLL superior segment subsolid nodule, 9 x 9 mm



# Case 2 Imaging

- RLL anterior basal segment cystic ground glass nodule, 25 x 20 mm



# Question for Dr. Tong

- What is your next step when you see a patient with ground glass nodules?

# Case 2

The patient is referred to Thoracic Surgery for evaluation of the nodules.

# Question for Dr. Cooke

- When should a patient be referred to thoracic surgery for management of lung nodules?

# Case 2 Continued

The patient’s case was reviewed by the thoracic surgeon and the patient was referred to interventional pulmonology. She underwent robotic assisted, cone beam CT-guided bronchoscopy with biopsy of the nodules.

All 3 targets showed adenocarcinoma with acinar growth on pathology. Lymph nodes sampled from stations 7, 11R, and 11Ri were negative for malignancy.

# Question for Dr. Shaller

- How does the management of ground glass nodules differ from the management of solid nodules?

# Case 2 Continued

The patient underwent a VATS-RLL lobectomy with lymph node dissection. Nodes were again confirmed negative on surgical pathology.

The patient was discharged home with plans to undergo SBRT to the RML nodule following recovery from surgery.

# Case 3

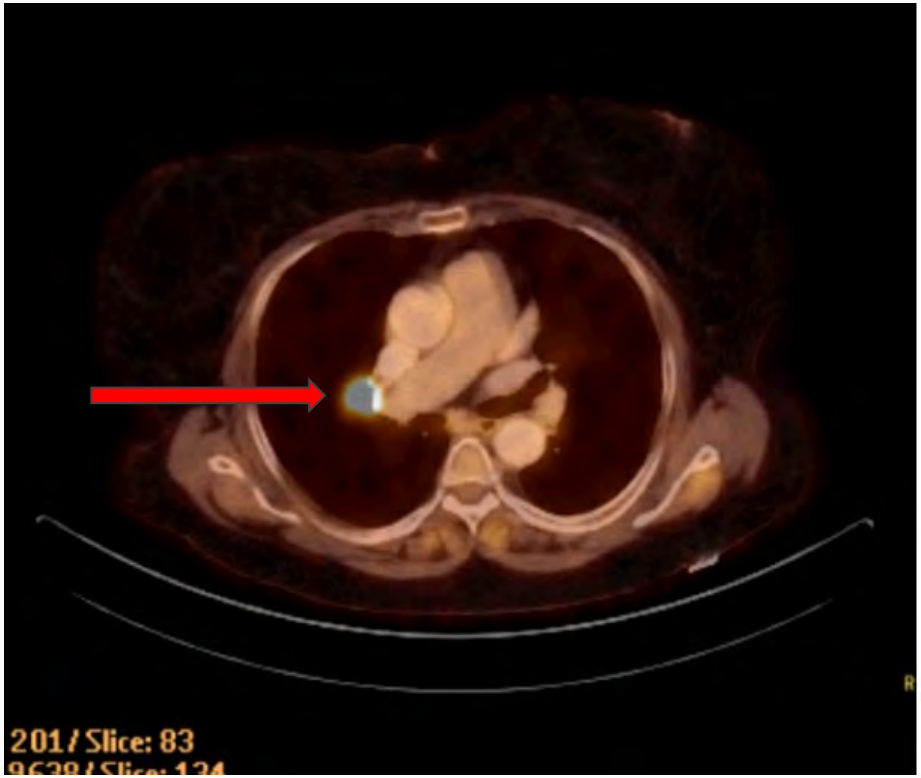
A 82 yo female is referred to the lung nodule clinic for evaluation of a new PET avid right hilar lymph node identified on surveillance imaging.

Her medical history is significant for diagnosis of RUL squamous cell carcinoma in 2019 with bony metastases to the ribs. She has been treated with carboplatin, taxol, and Keytruda with restaging imaging showing excellent response to treatment. She was then maintained on Keytruda alone for several years before stopping in 2022 due to development of pneumonitis.

She has a prior 20 pack year smoking history but quit in 2007. Over the past few months, she has noted 10 lb weight loss.

# Case 2 Imaging

- PET avid right hilar lymph node



# Question for Dr. Tong

- How frequently do you get surveillance imaging after treatment of the malignancy?

# Question for Dr. Shaller

- When is a biopsy indicated vs presuming recurrence of a prior confirmed diagnosis?

# Question for Dr. Cooke

- Is there a role for surgery in recurrent disease?

# Case 3 Outcome

- Stations 11R and 7 were sampled using EBUS and negative for malignancy
- Station 10R biopsy using EBUS contains atypical cells positive for p40 and panCK which are suspicious for metastatic squamous cell carcinoma
- Patient is referred by her oncologist to radiation oncology for consideration of CyberKnife radiation therapy

# Guideline Recommendations and Invasive Mediastinal Staging (*CHEST* 2021)

**TABLE 1** ] Guideline Recommendations and Invasive Mediastinal Staging

| Variable | CHEST | NCCN | CCO | NICE | ESTS/ERS/ESGE |
|---|---|---|---|---|---|
| Publication year | 2013 | 2020 | 2011 | 2019 | 2015 |
| Indications for invasive mediastinal staging | | | | | |
| Tumor > 3 cm | Yes | Yes | Yes | NS | Yes |
| Central tumor | Yes | Yes | Yes | NS | Yes |
| Tumor without PET uptake | NS | NS | NS | NS | Yes |
| Lymphadenopathy | Yes | Yes | Yes | Yes | Yes |
| Nodes showing positive PET results | Yes | Yes | Yes | Yes | Yes |
| Definition of central tumor | | | | | |
| Inner one third | Yes | ... | Yes | NS | Yes |
| Inner two thirds | ... | Yes | ... | NS | ... |
| First-line invasive mediastinal staging method | | | | | |
| EBUS | Yes | ... | ... | Yes | Yes |
| EBUS/EUS | Yes | ... | ... | Yes | Yes |
| Mediastinoscopy | ... | ... | Yes | ... | ... |
| Any method[a] | ... | Yes | ... | ... | ... |
| Indication for repeat invasive mediastinal staging | | | | | |
| Negative or nondiagnostic first-line endosonography findings | Yes | Yes | NS | Yes | Yes |
| Minimum extent of lymph node evaluation | | | | | |
| Three mediastinal lymph node stations | NS | NS | ... | NS | Yes |
| Five mediastinal lymph node stations | ... | NS | Yes | NS | ... |

CCO = Cancer Care Ontario; CHEST = American College of Chest Physicians; EBUS = endobronchial ultrasound; ESGE = European Society of Gastrointestinal Endoscopy; ERS = European Respiratory Society; ESTS = European Society of Thoracic Surgeons; EUS = esophageal ultrasound; NCCN = National Comprehensive Cancer Network; NICE = National Institute for Health and Care Excellence; NS = not specified.

[a]EBUS, EUS, mediastinoscopy, mediastinotomy, CT scanning-guided nodal aspiration, or a combination thereof.

# Q&A with the Audience

# Thank you for joining us!

# TNM Staging

| Primary tumor (T) | |
|---|---|
| **T category** | **Definition** |
| Tx | Tumor that is proven histopathologically (malignant cells in bronchopulmonary secretions/washings) but cannot be assessed or is not demonstrable radiologically or bronchoscopically. |
| T0 | No evidence of primary tumor. |
| Tis | Carcinoma in situ: |
| | Squamous cell carcinoma in situ. |
| | Adenocarcinoma in situ (pure lepidic pattern and $\leq$3 cm in greatest dimension). |
| T1 | Size: $\leq$3 cm. |
| | Airway location: in or distal to the lobar bronchus. |
| | Local invasion: none (surrounded by lung or visceral pleura). |
| | Subdivisions: T1mi: Minimally invasive adenocarcinoma (pure lepidic pattern, $\leq$3 cm in greatest dimension and $\leq$5 mm invasion)—T1a (size $\leq$1 cm)[a]—T1b (1 cm $<$ size $\leq$ 2 cm)—T1c (2 cm $<$ size $\leq$ 3 cm). |
| T2 | Any of the following characteristics: |
| | Size: >3 cm but $\leq$5 cm. |
| | Airway location: invasion of the main bronchus (regardless the distance to the carina) or presence of atelectasis or obstructive. |
| | Pneumonitis that extends to hilar region (whether it is involving part or the entire lung). |
| | Local invasion: visceral pleura (PL1 or PL2). |
| | Subdivisions: T2a (3 cm $<$ size $\leq$ 4 cm or cannot be determined) and T2b (4 cm $<$ size $\leq$ 5 cm). |
| T3 | Any of the following characteristics: |
| | Size: >5 cm but $\leq$7 cm. |
| | Local invasion: direct invasion of chest wall (including superior sulcus tumors), parietal pleura (PL3), phrenic nerve, or parietal pericardium. |
| | Separate tumor nodule(s) in the same lobe of the primary tumor. |
| T4 | Any of the following characteristics: |
| | Size >7 cm. |
| | Airway location: invasion of the carina or trachea. |
| | Local invasion: diaphragm, mediastinum, heart, great vessels, recurrent laryngeal nerve, esophagus or vertebral body. |
| | Separate tumor nodule(s) in an ipsilateral different lobe of the primary tumor. |

# TNM Staging

| Lymph nodes (N) | |
|---|---|
| **Descriptor** | **Definition** |
| Nx | Regional lymph nodes cannot be evaluated. |
| N0 | No regional lymph nodes involvement. |
| N1 | Involvement of ipsilateral peribronchial and/or ipsilateral hilar lymph nodes (includes direct extension to intrapulmonary nodes). |
| N2 | Involvement of the ipsilateral mediastinal and/or subcarinal lymph nodes. |
| N3 | Involvement of any of the following lymph node groups: contralateral mediastinal, contralateral hilar, ipsilateral or contralateral scalene, or supraclavicular nodes. |
| **Distant metastasis (M)** | |
| **Descriptor** | **Definition** |
| M0 | No distant metastasis. |
| M1 | Presence of distant metastasis. |
| | Subdivisions: M1a (separate tumor nodule(s) in a contralateral lobe to that of the primary tumor or tumors with pleural or pericardial nodules or malignant effusion); M1b (single extrathoracic metastasis); M1c (multiple extrathoracic metastases to one or more organs). |

Note: Tumor's size is determined by the greatest dimension of the lesion.

[b]The uncommon superficial spreading tumor with invasive component limited to bronchial wall is classified as T1a regardless of size or extent to main bronchus.

# Dyssynchronous Waveforms

**Rob Bautista, BSRT, RRT, RRT-ACCS**
**Respiratory Therapist**
**UC San Francisco**

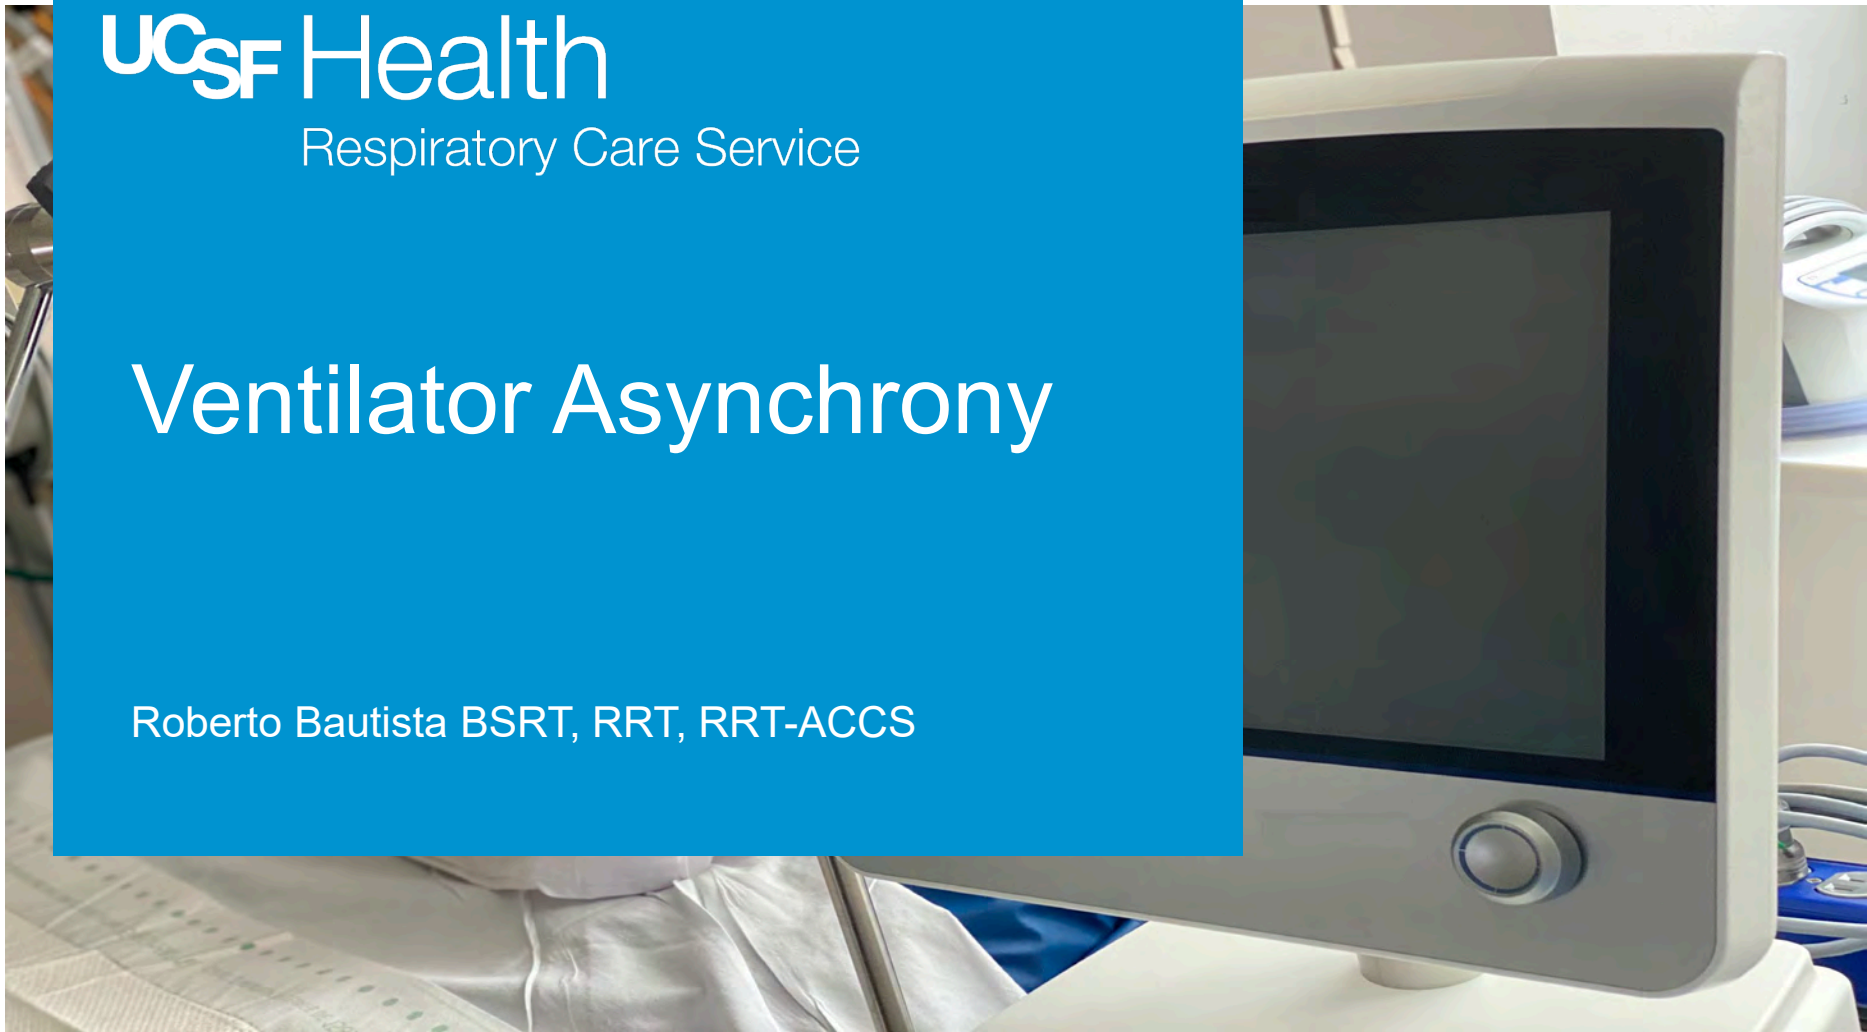
Roberto Bautista received his Baccalaureate Degree from Boise State University and is pursuing his Masters Degree at UCSF. He is a Clinical Specialist for the Respiratory Care Services department at UCSF with a focus on Adult Critical Care. Roberto is the CSRC-AARC Delegate and is a member of the CSRC Executive Committee.

UCSF Health

Respiratory Care Service

# Ventilator Asynchrony

Roberto Bautista BSRT, RRT, RRT-ACCS



# Relevant Financial Disclosure(s)

## Roberto Bautista BSRT, RRT, RRT-ACCS

- I have no conflicts of interest.

# Ventilator Asynchrony

## Introduction

- Mechanical ventilation is a supportive treatment for improving oxygenation and/or ventilation, unloading the respiratory muscles, and gaining time until the patient's condition improves.
- Patient-ventilator asynchrony can be defined as a mismatch between the patient and ventilator timing and/or effort.

# Ventilator Asynchrony

Asynchronies can result in dyspnea, anxiety, delirium, cognitive alterations, and self-inflicted lung injury; they could also induce vigorous inspiratory efforts leading to high stress (i.e., elevated transpulmonary pressure), strain (i.e., global or regional lung overdistention), and consequent diaphragm and lung injury. Asynchronies are also associated with longer duration of mechanical ventilation.

Esperanza, JA, Respiratory Care 2020

# Objectives

# Ventilator Asynchrony

## Objectives

- Interpret waveforms
- Identify and define type of asynchrony
- Discuss possible interventions and/or adjustments
- Evaluate efficacy of current plan

# Physiology

# Ventilator Asynchrony

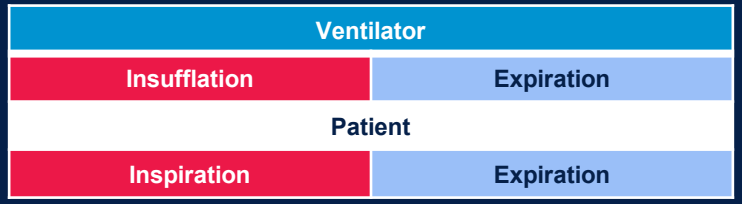
## Mechanisms

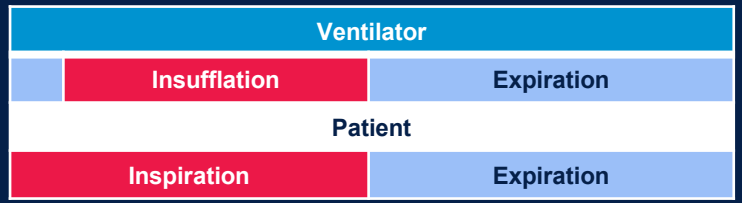
### Main mechanisms of Asynchrony

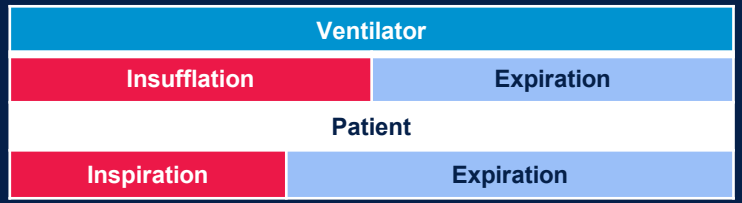
Timing of the patient is mismatched with the timing of the ventilator

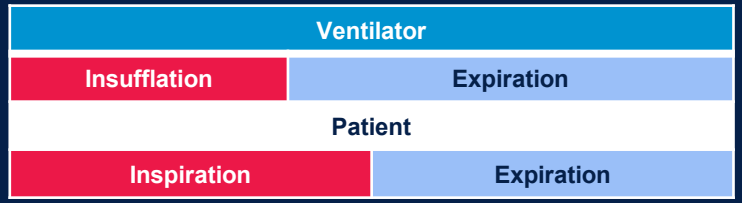
Imbalances in the amount work of breathing by the patient and the amount mechanical assist delivered during inspiration.

# Neural/Ventilator Timing Mismatch









UCSF Health
Respiratory Care Service

# Respiratory Drive/Mechanical Assist Mismatch

## High Respiratory Drive

(CNS, Metabolic, Respiratory Failure)

Insufficient ventilatory assist

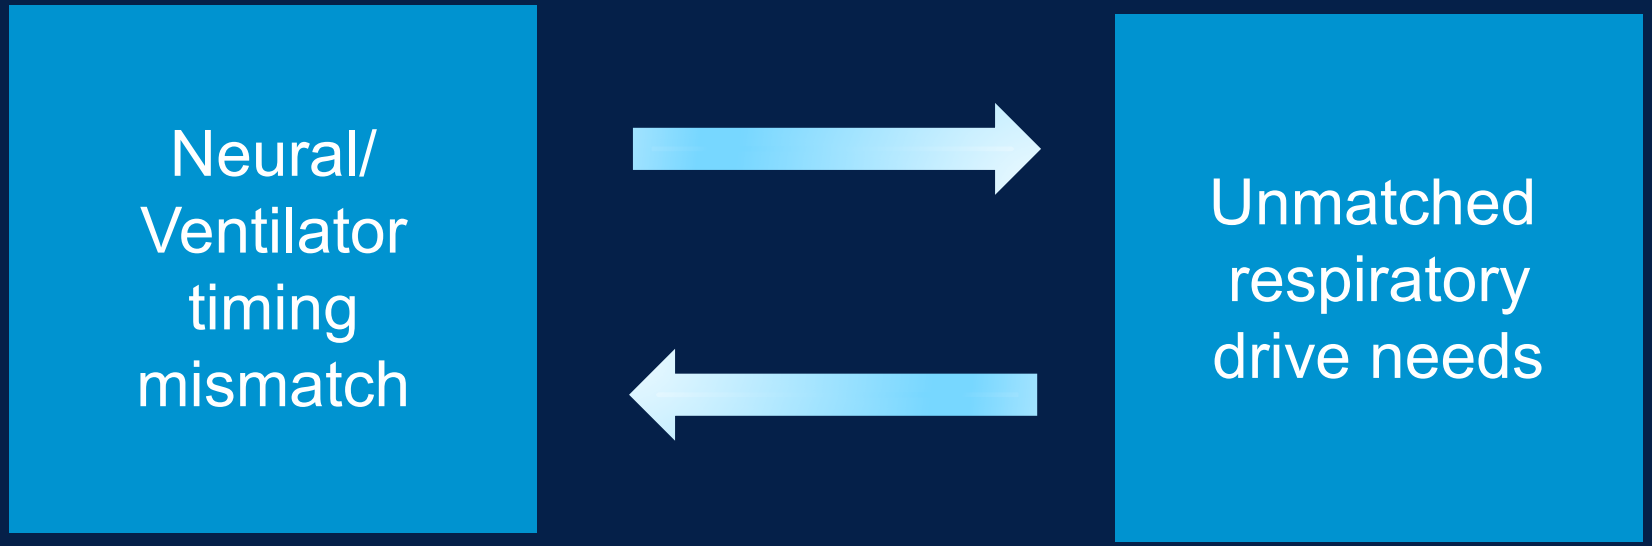
Intrinsic to patient's disease state

## Low Respiratory Drive

Excessive ventilatory assist

Excessive sedation

# Asynchrony Interactions



# Ventilator Asynchrony

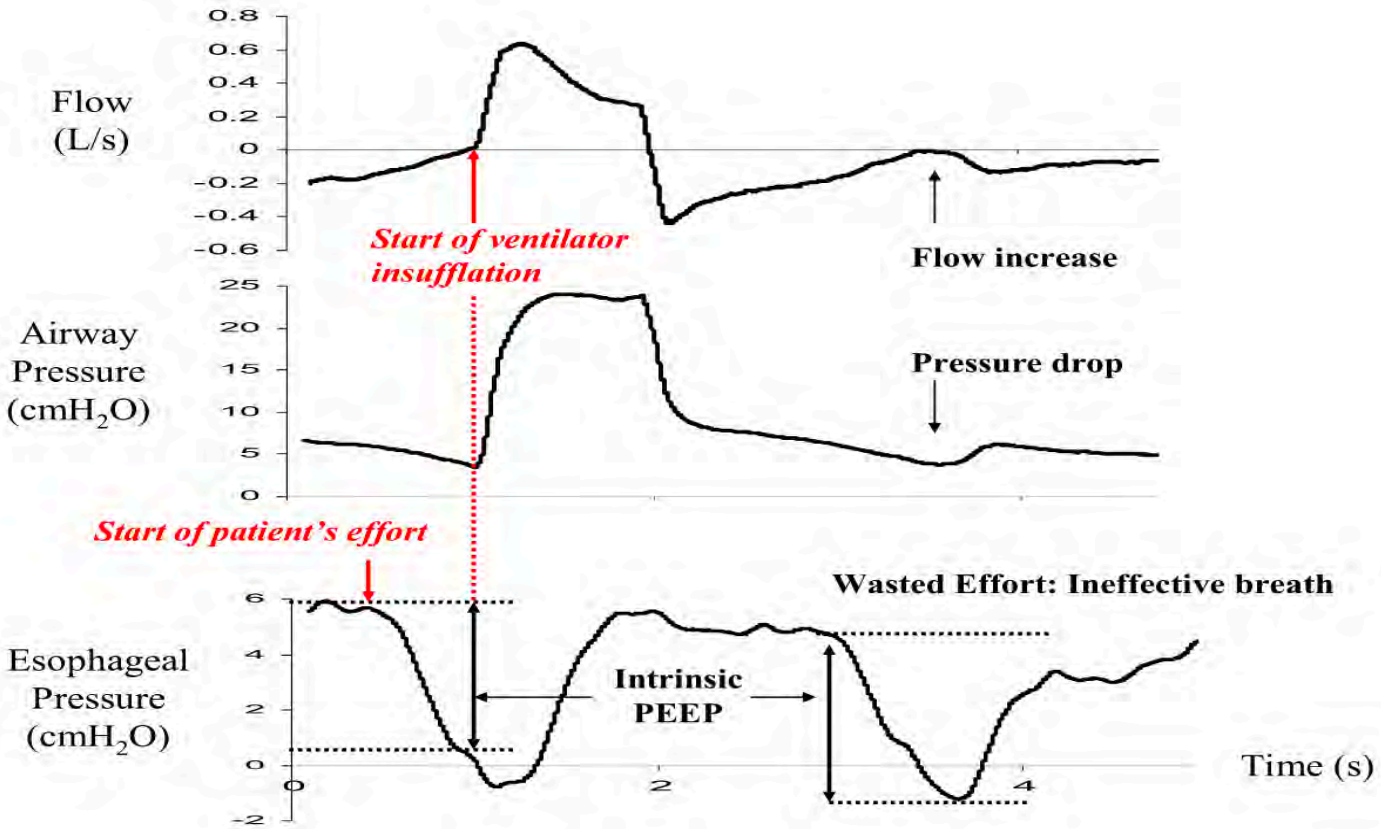
## What Phase?

- When does the asynchrony occur?
  - Inspiratory Trigger
  - Inspiratory Limit
  - Inspiratory Cycle
  - Expiratory

# Cases

# #1

UCSF Health
Respiratory Care Service



Thille, AW, Intensive Care Medicine 2008

UCSF Health
Respiratory Care Service

# Missed/Ineffective Trigger

- What phase is this in?
  - Inspiratory trigger
- Causes
  - Trigger sensitivity high
  - High set inspiratory pressure
  - Set frequency and/or I-time set too high
  - Presence of AutoPEEP
  - Low respiratory drive
  - Weak inspiratory effort
  - Sedation

# Missed/Ineffective Trigger

- Interventions
  - Decrease trigger sensitivity
  - Decrease set inspiratory pressure
  - Increase PEEP
  - Decrease sedation
  - Increase pt strength

# #2

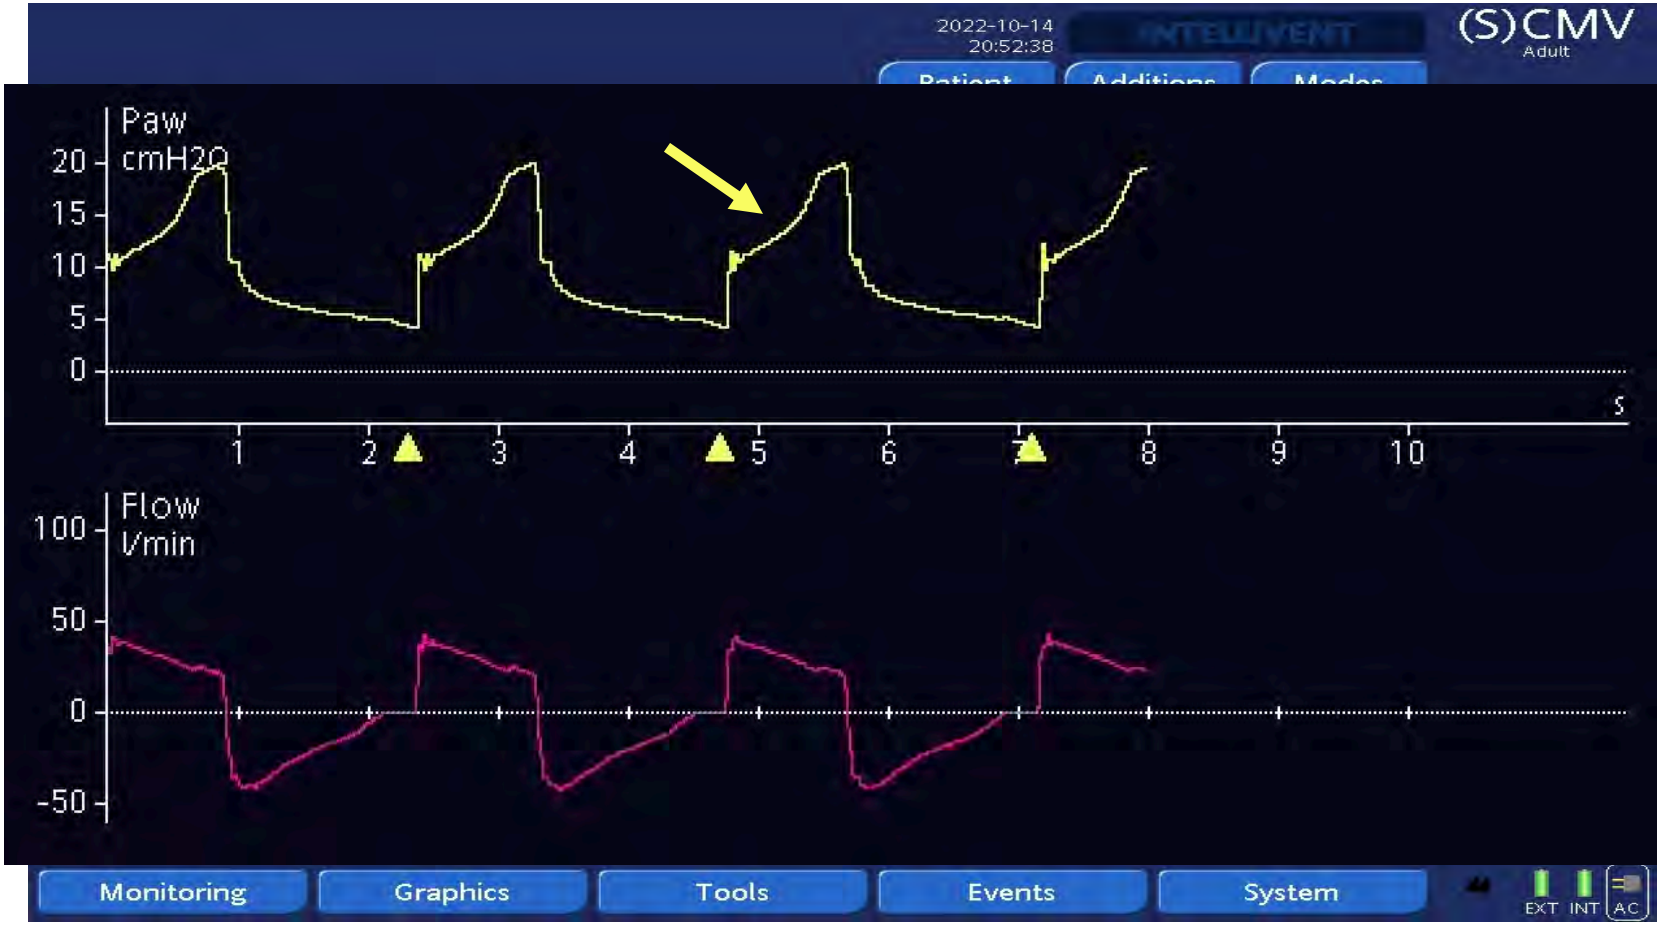
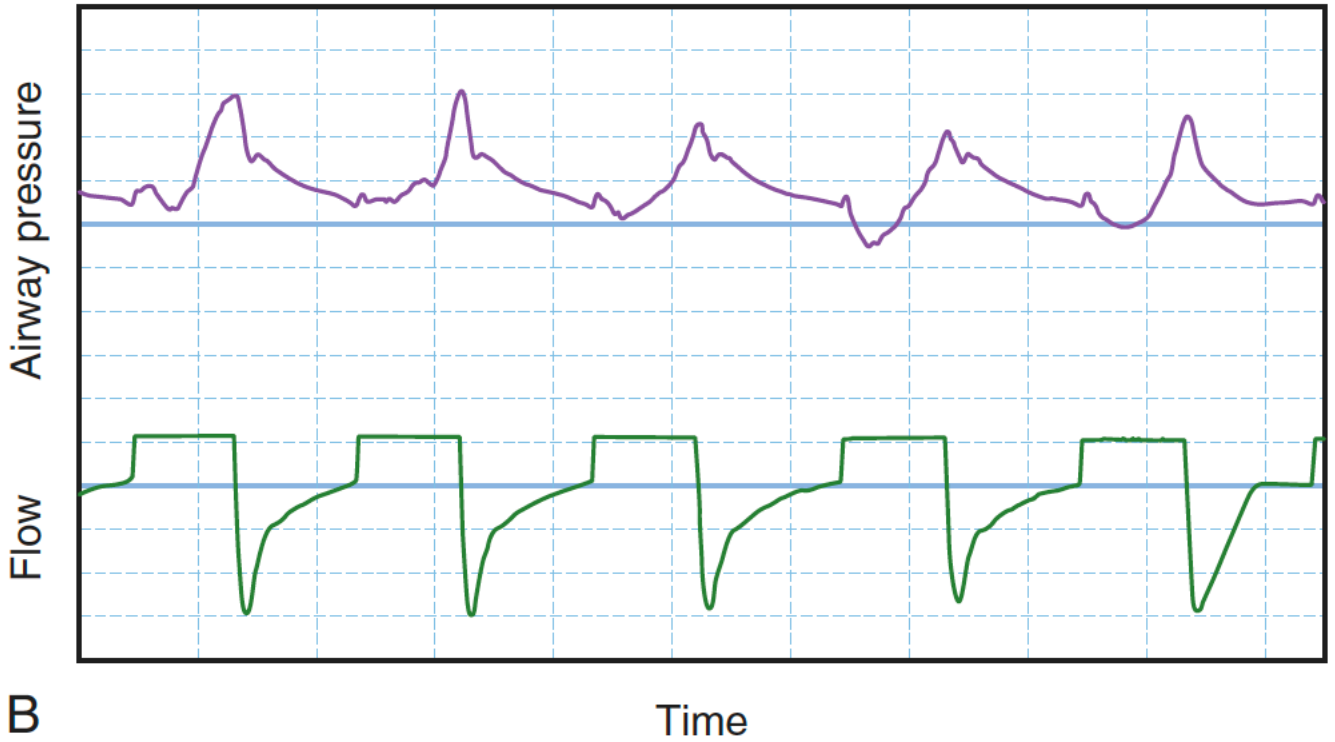
Respiratory Care Service

# #2



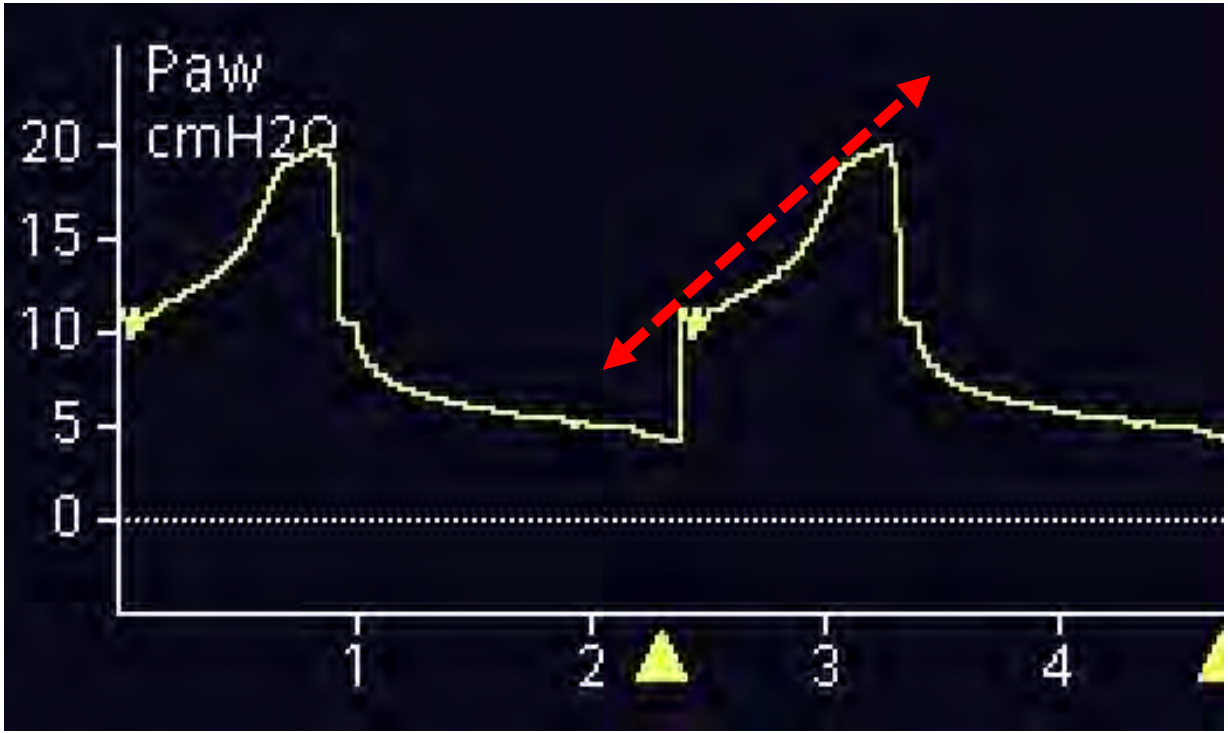
UCSF Health
Respiratory Care Service

Flow asynchrony occurs when the set ventilator flow does not meet the patient inspiratory flow demand



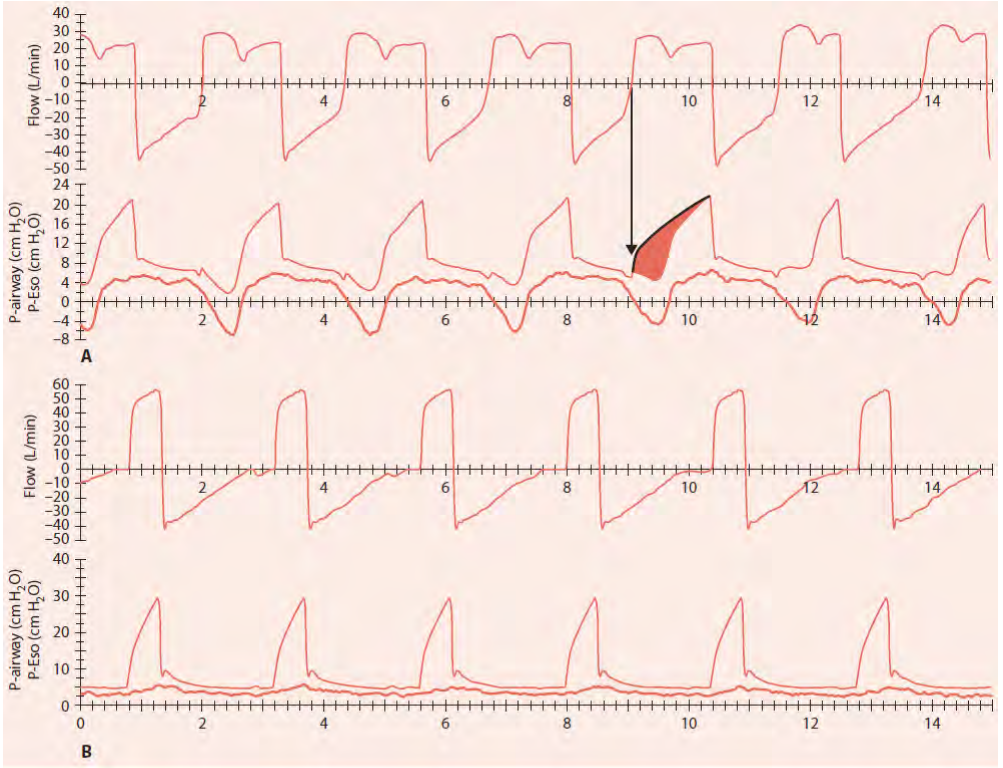
Kacmarek, R, Egan's Fundamentals of Respiratory Care 2021

Generally recognized by concave pressure-time scalar. Also termed “Air Hunger”



# Flow Asynchrony

- What phase is this in?
  - Inspiratory Limit
- Causes
  - Inappropriate vent mode
  - High Inspiratory Effort
  - Inappropriate Flow/ Time setting
  - Decreased Vt

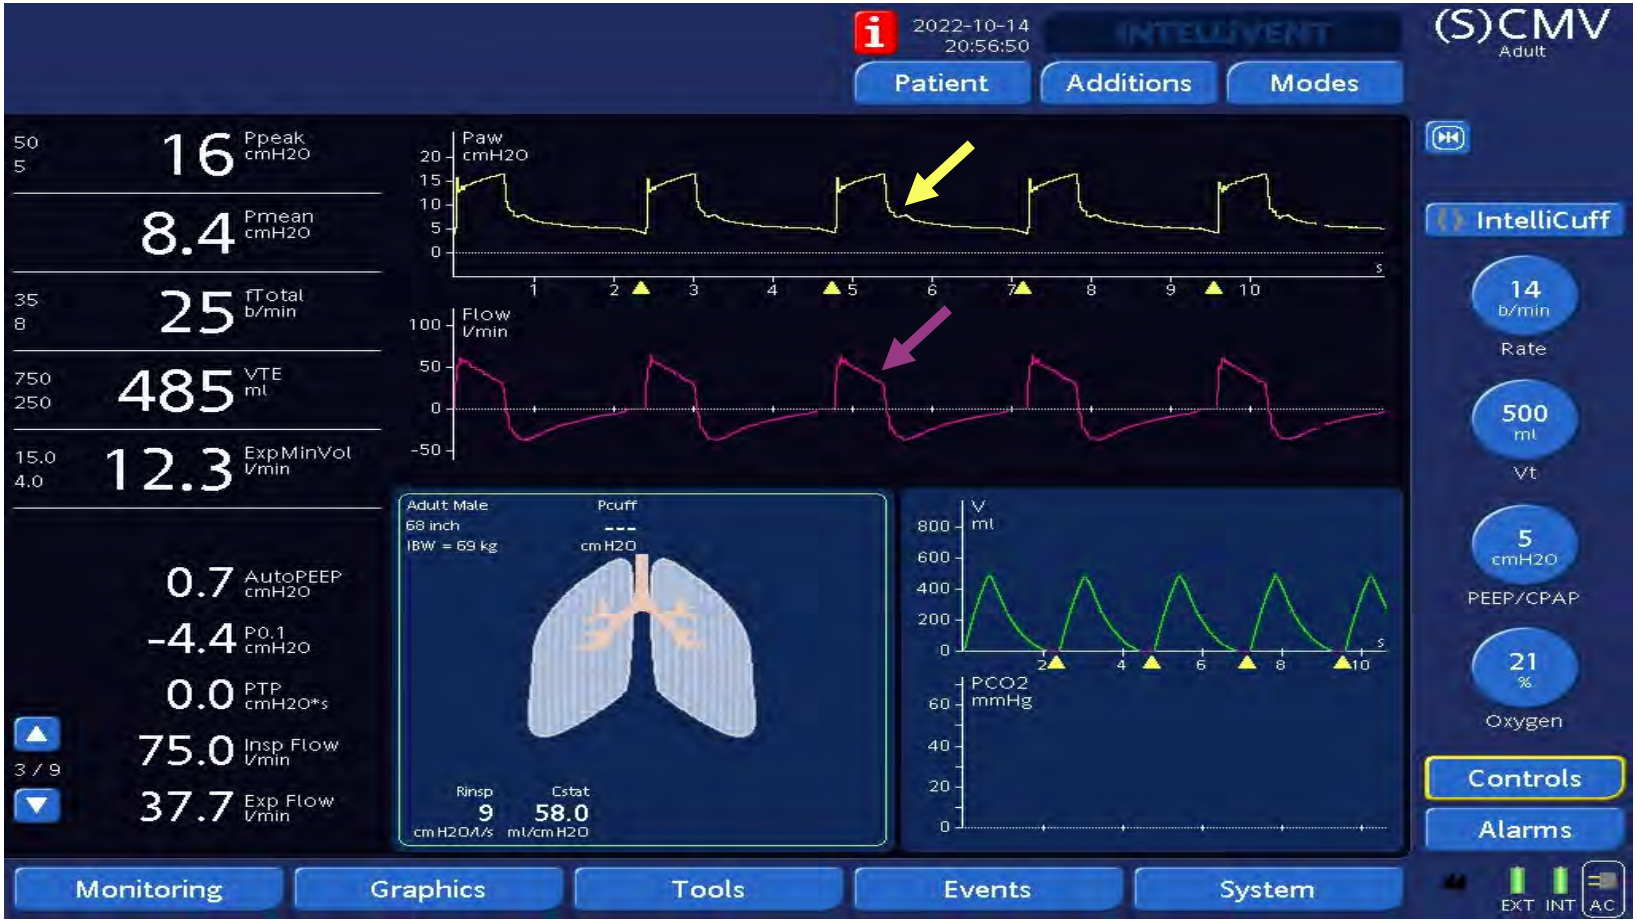


# Flow Asynchrony

- Interventions
  - Select appropriate mode
  - Increase Flow and/or Vt
  - Adjust time setting

# #3

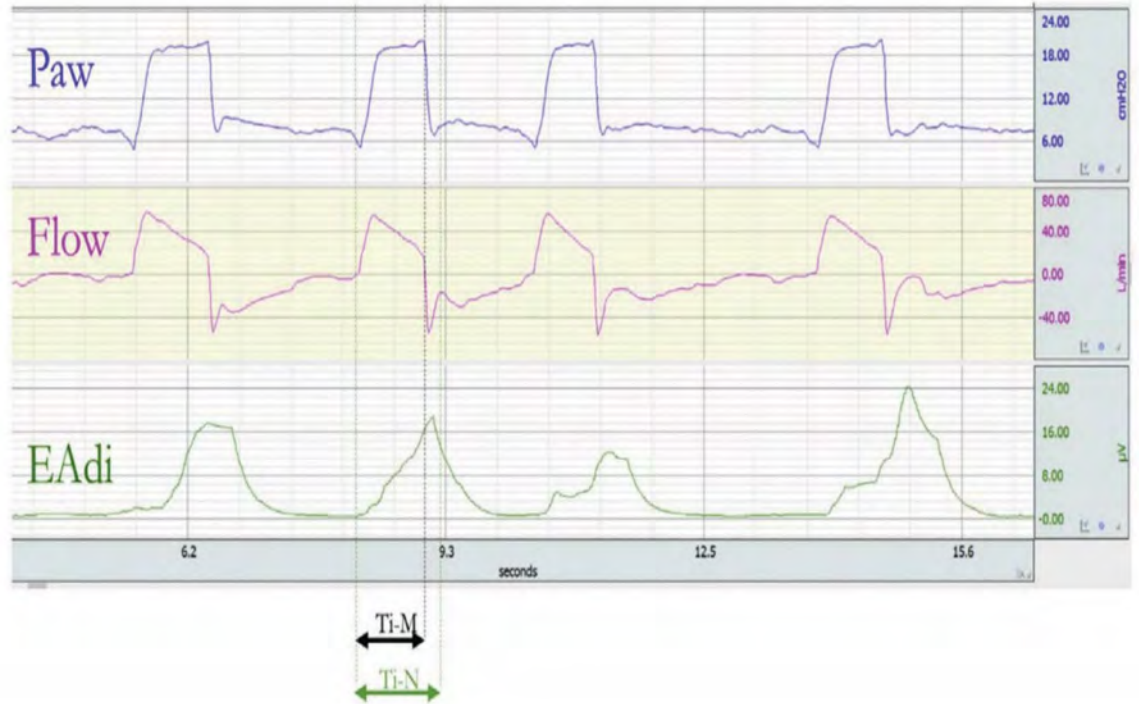
**0.6s**



UCSF Health
Respiratory Care Service

# Premature/Short Cycling

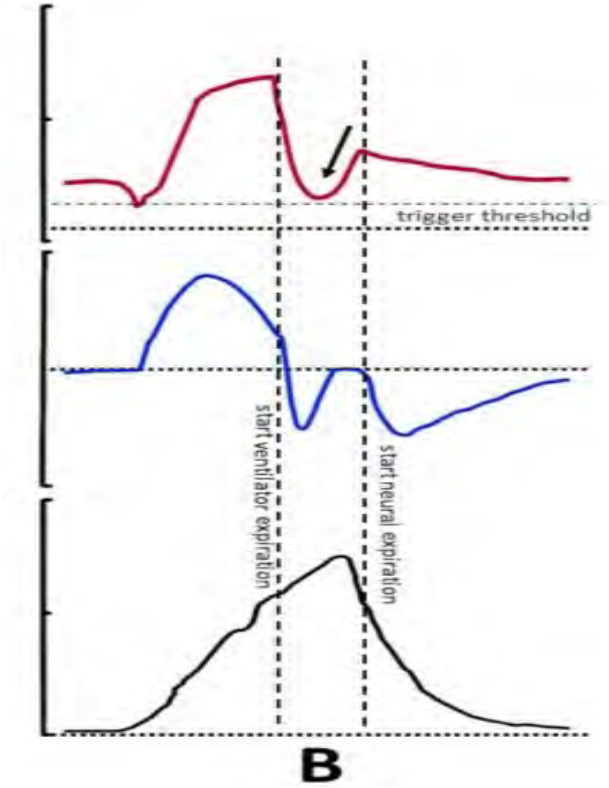
Short cycling occurs when the inspiratory time set by the ventilator is less than the neural timing of the patient.



De Oliveira, B, Journal of Clinical Medicine 2021

# Premature/Short Cycling

- When does this occur?
  - Inspiratory Cycle
- Causes
  - I-time set too low
  - High Inspiratory Effort
  - Vt set too low



Enrico, B, Acta Biomedica 2018

# Premature/Short Cycling

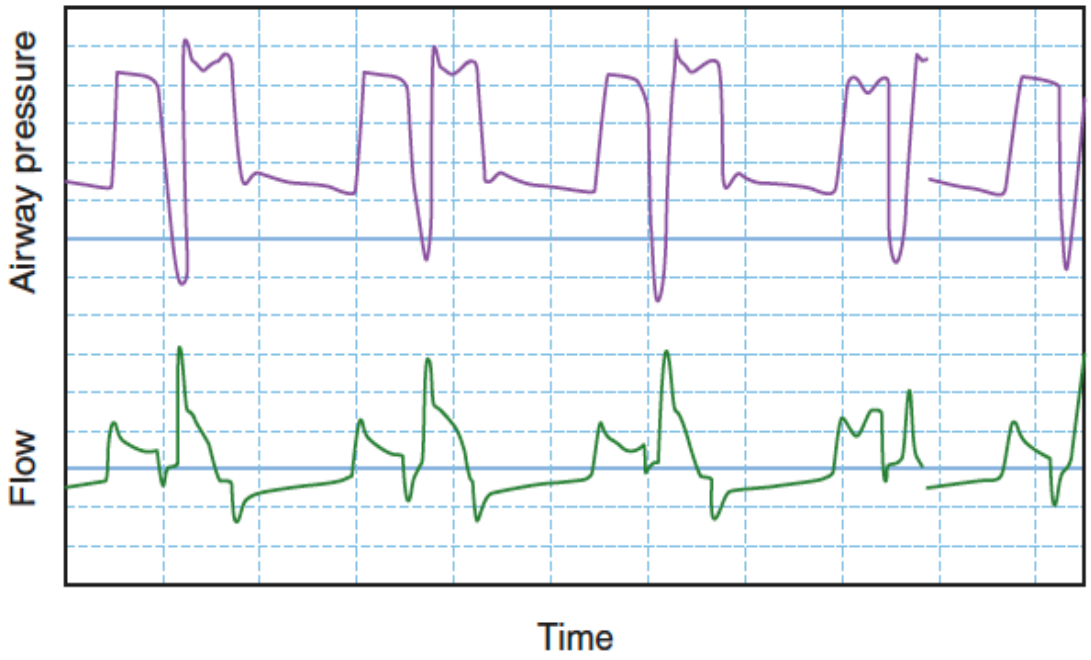
- Interventions
  - Adjust I-time
  - Increase Vt
  - Select to appropriate mode
  - Decrease cycle criterion

# #4

UCSF Health
Respiratory Care Service

# Double Triggering

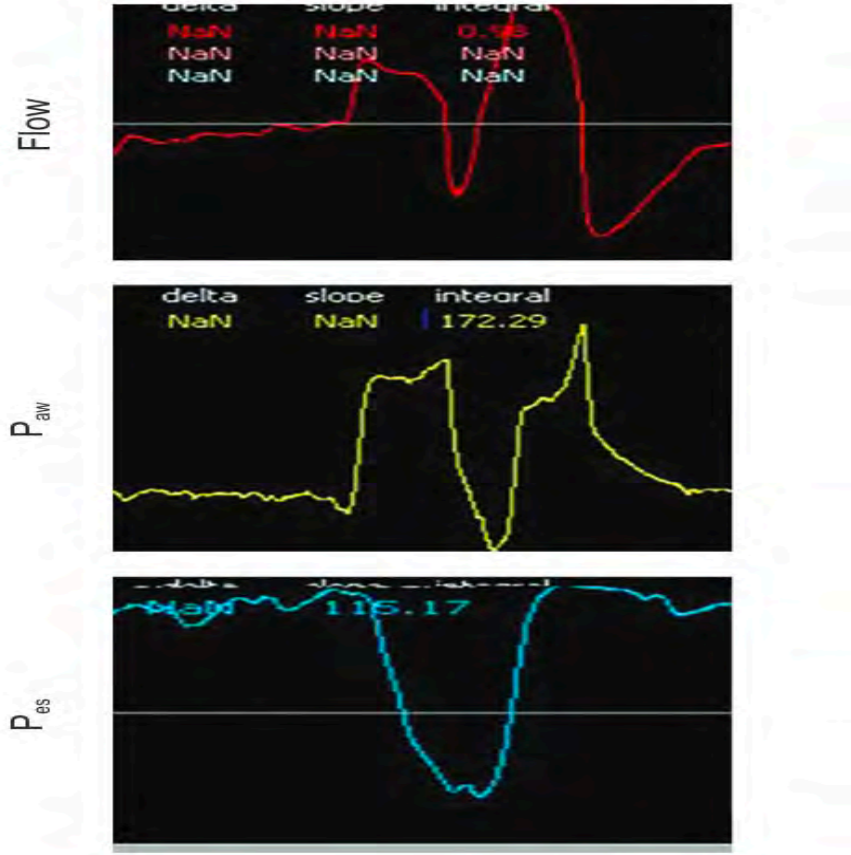
Aka Breathstacking occurs when there is no expiration or very little expiration between breaths.



Kacmarek, R, Egan's Fundamentals of Respiratory Care 2021

# Double Triggering

- What phase is this in?
  - Inspiratory cycle
- Causes
  - High inspiratory demand
  - Inspiratory time too short
  - Vt too low
  - Cycle criterion too high



Mirabella, L, Respiratory Care 2020

UCSF Health
Respiratory Care Service

# Double Triggering

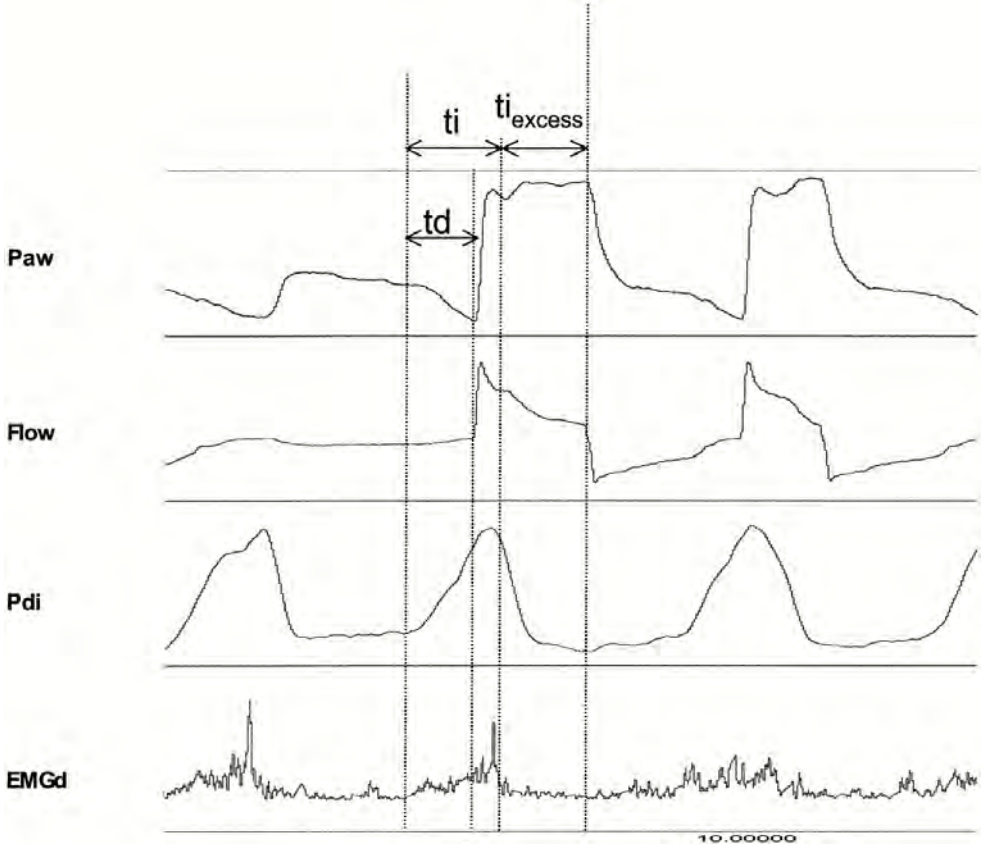
- Interventions
  - Increase Vt
  - Increase peak flow to match demand
  - Increase I-time to match patient's neural timing
  - Mode change to Pressure Support
  - Increase sedation

# #5

UCSF Health
Respiratory Care Service

# Delayed Cycling

- What phase is this in?
  - Inspiratory Cycle
- Causes
  - Cycle % set too low
  - I-time too long
  - Too much support/volume

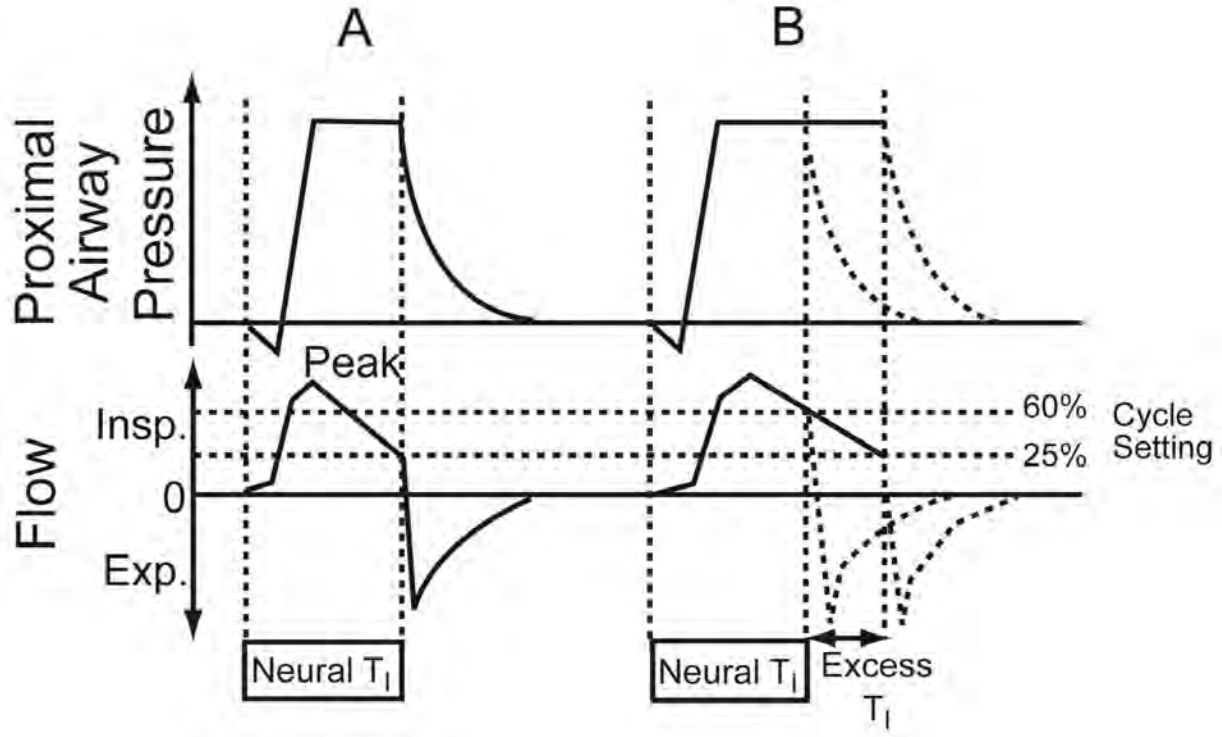


Tassaux, D, AJRCCM 2005

UCSF Health
Respiratory Care Service

# Delayed Cycling

Delayed Cycling is active expiratory effort before the cycling criterion is met.



Gentile, MA, Respiratory Care 2011

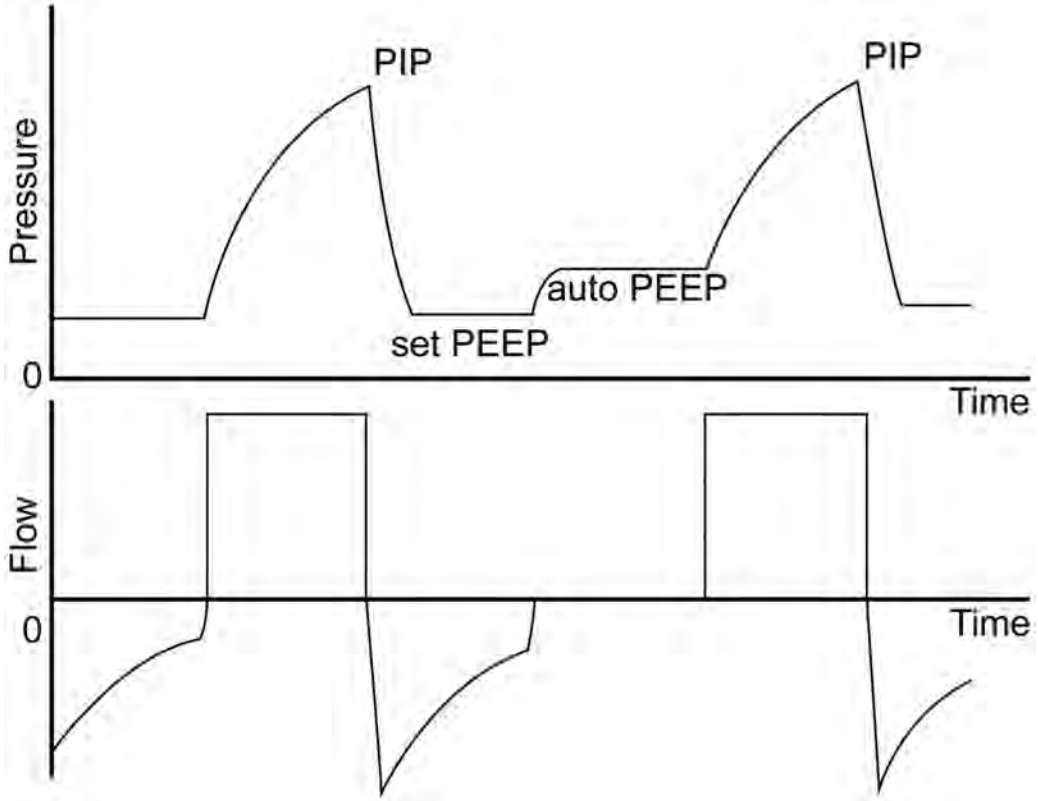
# Delayed Cycling

- Interventions
  - Increase cycling criterion
  - Decrease I-time
  - Decrease support/volume

UCSF Health
Respiratory Care Service

# Auto-PEEP

Auto-PEEP (Intrinsic PEEP) is incomplete emptying of the lungs occurs if the expiratory phase is terminated prematurely.



Hess, D, Respiratory Care 2014

UCSF Health
Respiratory Care Service

# Auto-PEEP

- What phase is this in?
  - Expiratory
- Causes
  - Inappropriate E-time
  - Inappropriate RR
  - Inappropriate Vt

Total PEEP = Set PEEP + AutoPEEP

UCSF Health
Respiratory Care Service

# Auto-PEEP

- Interventions
  - Adjust E-time
  - Adjust RR
  - Adjust Vt
  - Increase PEEP
  - Bronchodilators

# Summary

- Asynchronies are common
- Must be able to identify type of asynchrony
- Some can be resolved with vent interventions, others require chemical interventions
- Asynchronies if left untreated can be harmful

**The capacity to learn is a GIFT; the ability to learn is a SKILL; the willingness to learn is a CHOICE.**

# Questions

Roberto.Bautista@ucsf.edu

# Optimizing Lung Recruitment in Challenging Populations Post-Intubation

**Alex Kristine Pearce, MD**
**Associate Physician Diplomate**
**UC San Diego**

Dr. Alex Pearce received her medical degree from Tulane School of Medicine followed by residency in Internal Medicine at UC San Diego. She subsequently completed her clinical fellowship in Pulmonary and Critical Care and research fellowship at UC San Diego. She currently works as an intensivist at UC San Diego with a research focus on mechanical ventilation and Acute Respiratory Distress Syndrome.

# OPTIMIZING LUNG RECRUITMENT IN CHALLENGING POPULATIONS POST-INTUBATION: INTRODUCTION TO ELECTRICAL IMPEDANCE TOMOGRAPHY (EIT)

CTS March 2024

Alex Kristine Pearce MD

UC San Diego, Division of Pulmonary and Critical Care

California Thoracic Society

# RELEVANT FINANCIAL DISCLOSURES

- I have the following relationships with ACCME defined ineligible companies: N/A

- I WILL discuss off-label use and/or investigational use of any drugs or devices.

California Thoracic Society

# Outline/Objectives

- Review pertinent background in VILI, pleural pressure gradients, distribution of ventilation.
- Recognize challenges in lung protective ventilation
- Introduction to principles of EIT
- Understand how EIT can be used in a clinical/research setting

# Background: VILI (Ventilator induced lung injury)

- Several mechanisms
  - volutrauma: injury from high volumes
  - Barotrauma: injury from high pressures
  - Atelectrauma: injury from repetitive opening/closing
  - Dys-synchrony: injury from pendelluft

Lung strain

(Tidal volume/FRC)

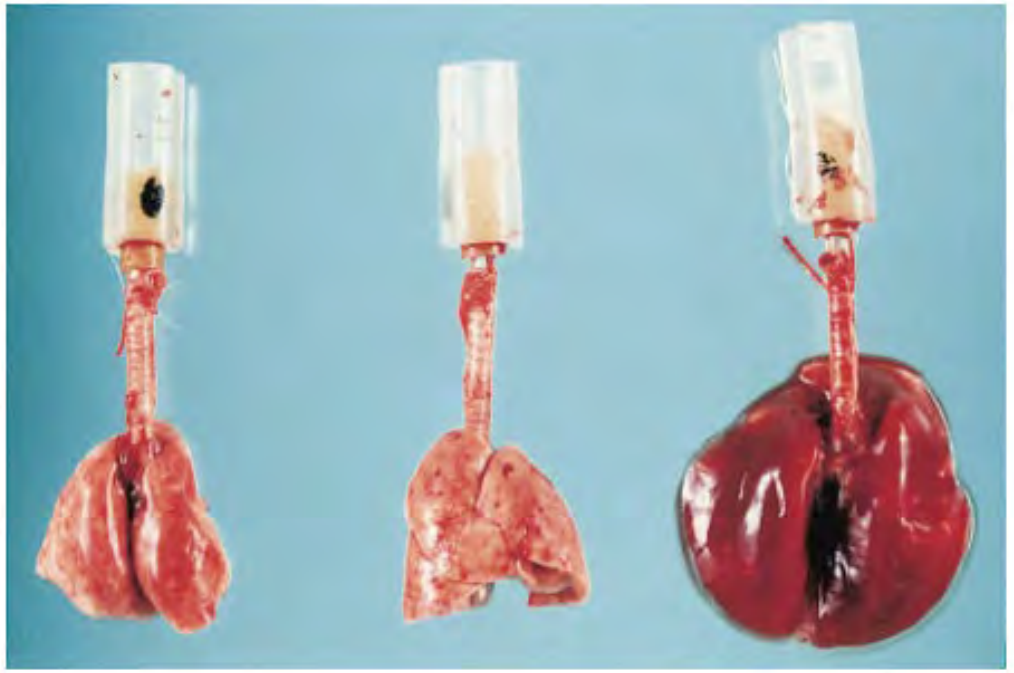
Lung Stress

(plateau or transpulmonary pressure)

Volu-trauma

Baro-trauma

↑ Mortality& morbidity



**Dreyfuss and Saumon. AJRCCM 1998.**

# Background: Lung Protective Ventilation

Lung protection (traditional)
Low tidal volumes→ 6 cc/kg IBW
Plateau Pressure <30, Low Driving pressure <15 cmH2O
Open lung strategy (avoid cyclical atelectasis)
Prone positioning

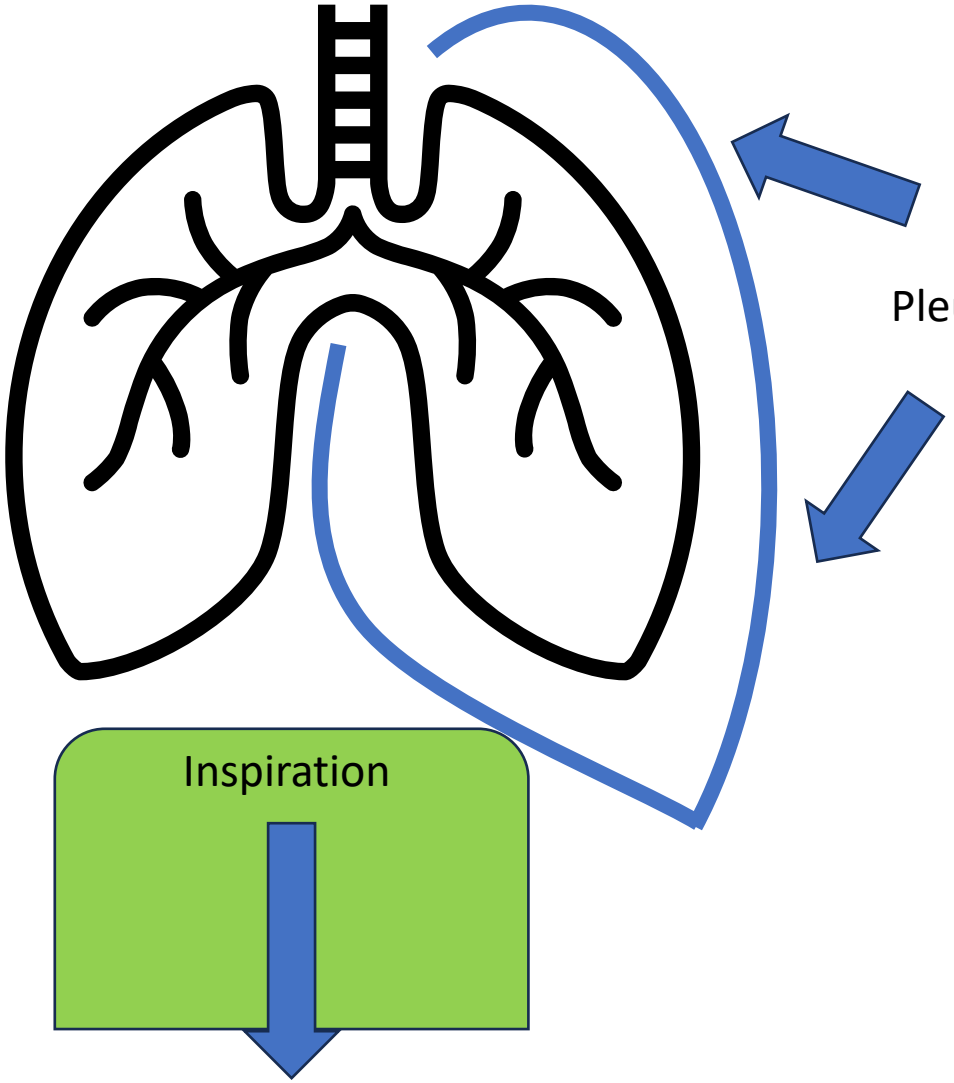
Is this always enough? No
Can harm/VILI still occur? Yes

Why?– Current approaches only focus on global metrics and neglect assessment of regional stress/strain

# Background: regional ventilation in health and disease

- Time-constants (resistance x compliance)
- Airway closure below FRC
- Pleural pressure gradients (transpulmonary pressure)
- Parenchymal heterogeneity

# Pleural pressure



**Perfect world**: transpulmonary pressure would be the same throughout the lung

Pleural pressure (-10 cmH2O)

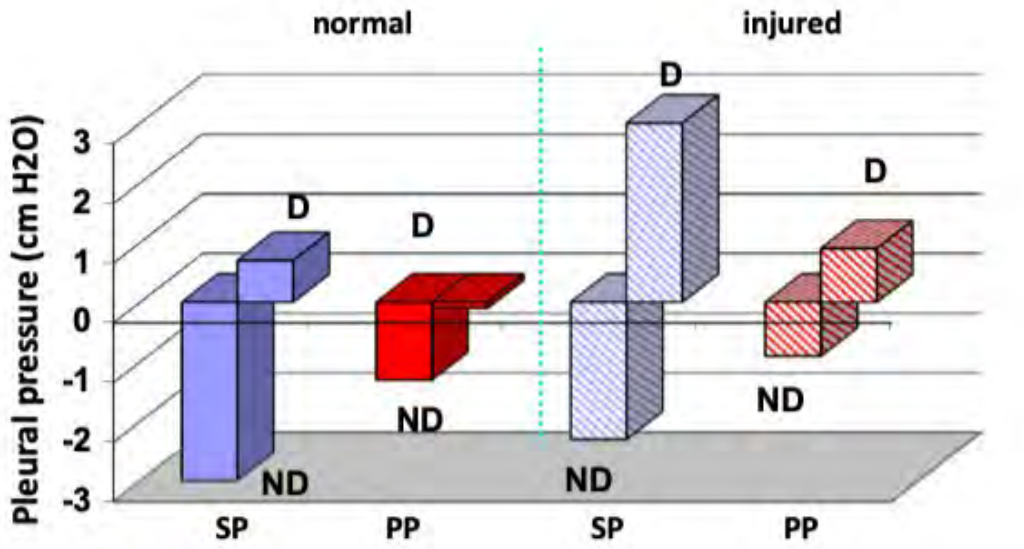
Transpulmonary pressure= Airway Pressure – Pleural Pressure

# Pleural pressure gradients are complicated

## Real world: Pleural pressure is WAY MORE complicated

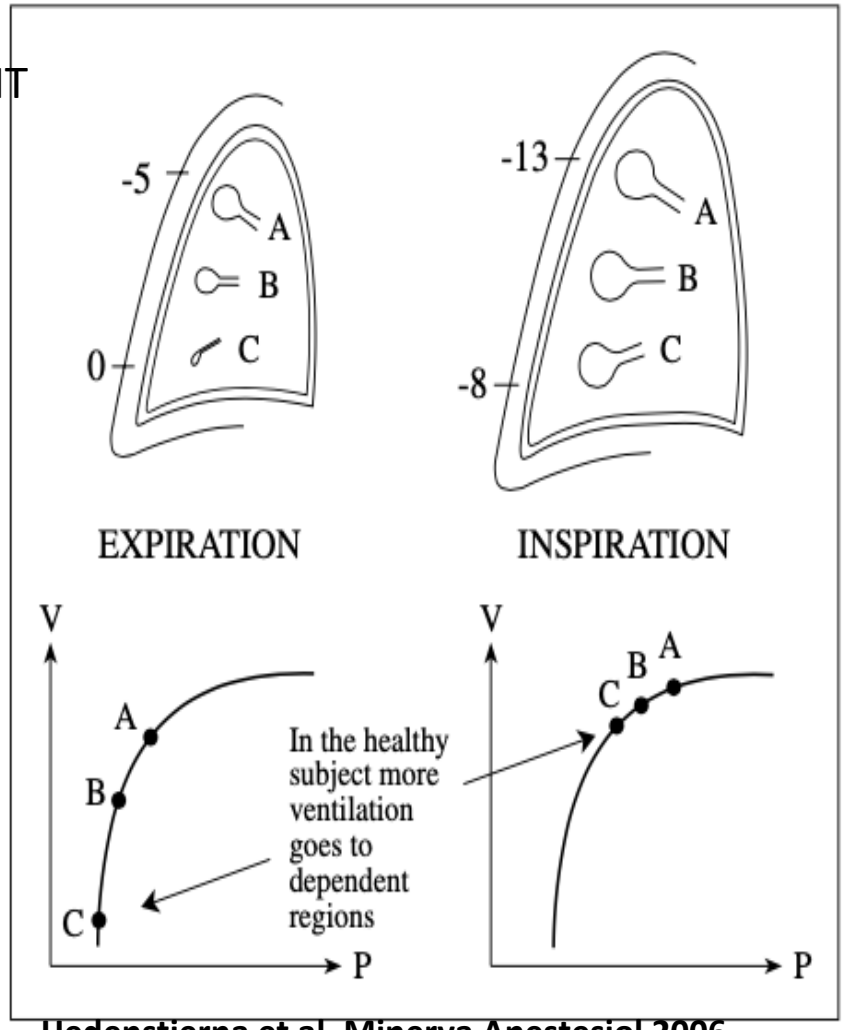
Pleural pressure gradients + heterogeneity in lung injury

1. Gravity (both apical/basilar and Ventral/dorsal)
2. Lung injury make gradients worse



Guerin et al. Intensive Care Med 2014.

UPRIGHT



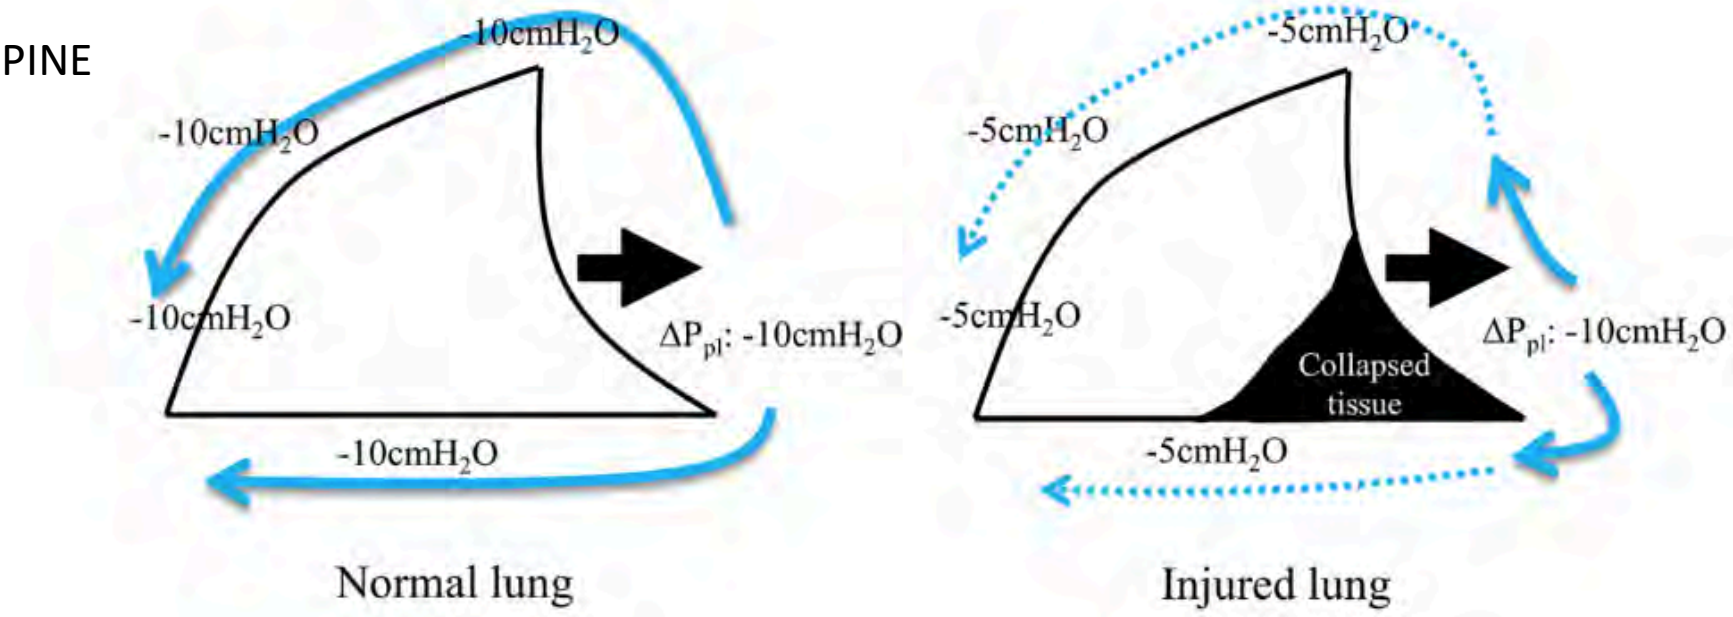
Hedenstierna et al. Minerva Anestesiol 2006.

# Pleural pressure gradients are complicated

Why does this matter?

heterogeneous lung parenchyma+ uneven distribution of pleural pressure→ variable transpulmonary pressure in different parts of the lung
→difficult to ventilate all parts of lung safely

SUPINE



**Yoshida et al J Intensive Care. 2015. PMID: 27408729.**

# Options in a patient who is difficult to ventilate/oxygenate?

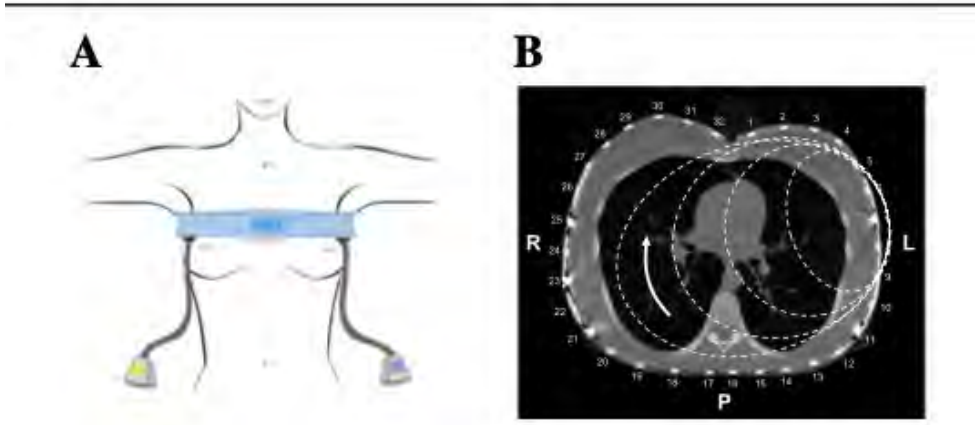
1. Esophageal manometry
2. Pressure volume curves
3. Recruitment maneuvers and best compliance

Only estimates pleural pressure at mid-thorax (at best the mid to dorsal lung- misses ventral, apex, base)

Treat the lung as a whole/average→ but injured lung tends to be heterogenous with complex pleural pressure gradients

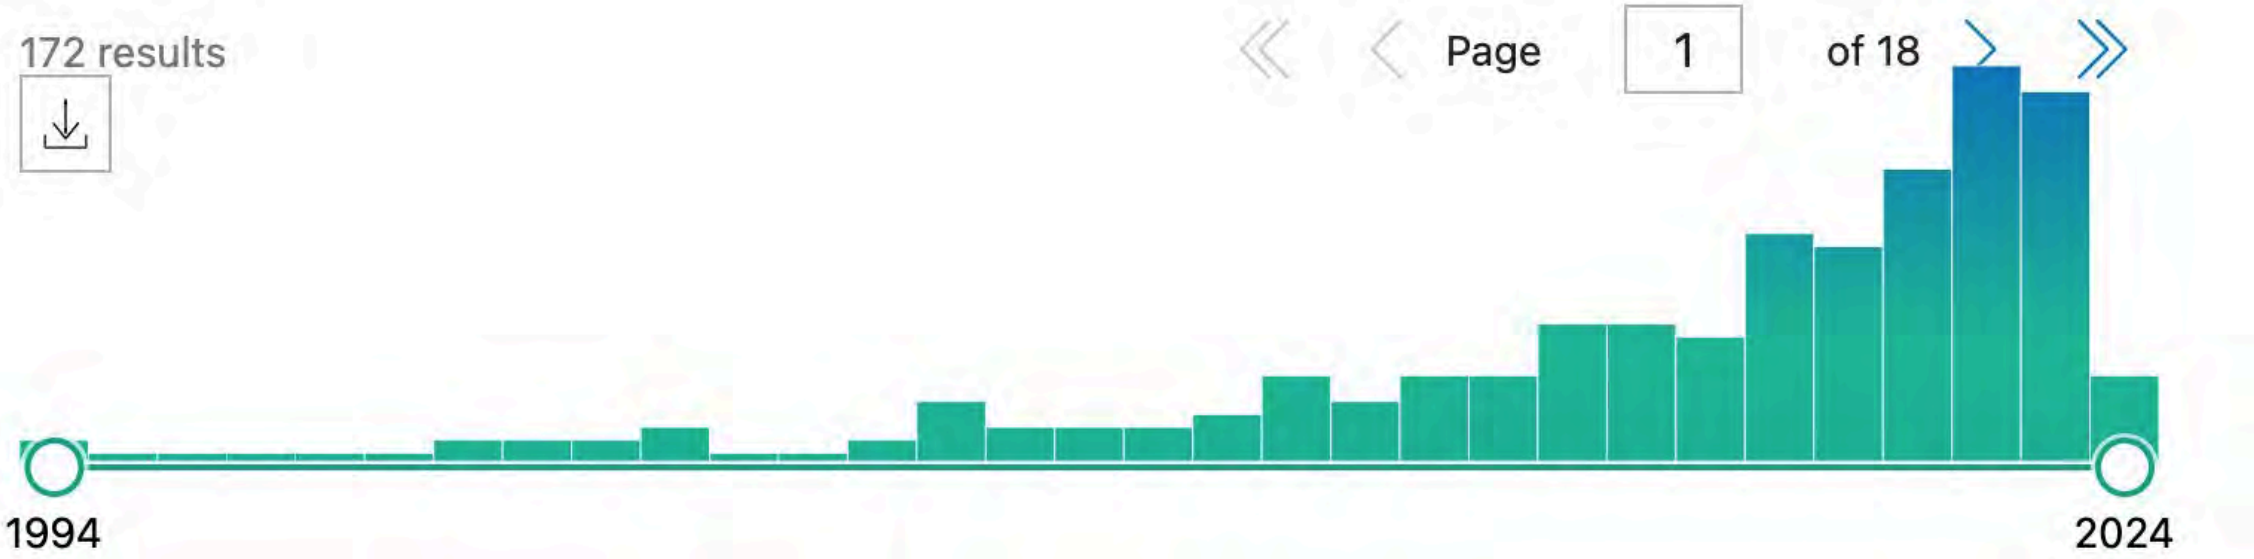
4. Electrical impedance Tomography? (EIT)

# EIT in ARDS: growing interest



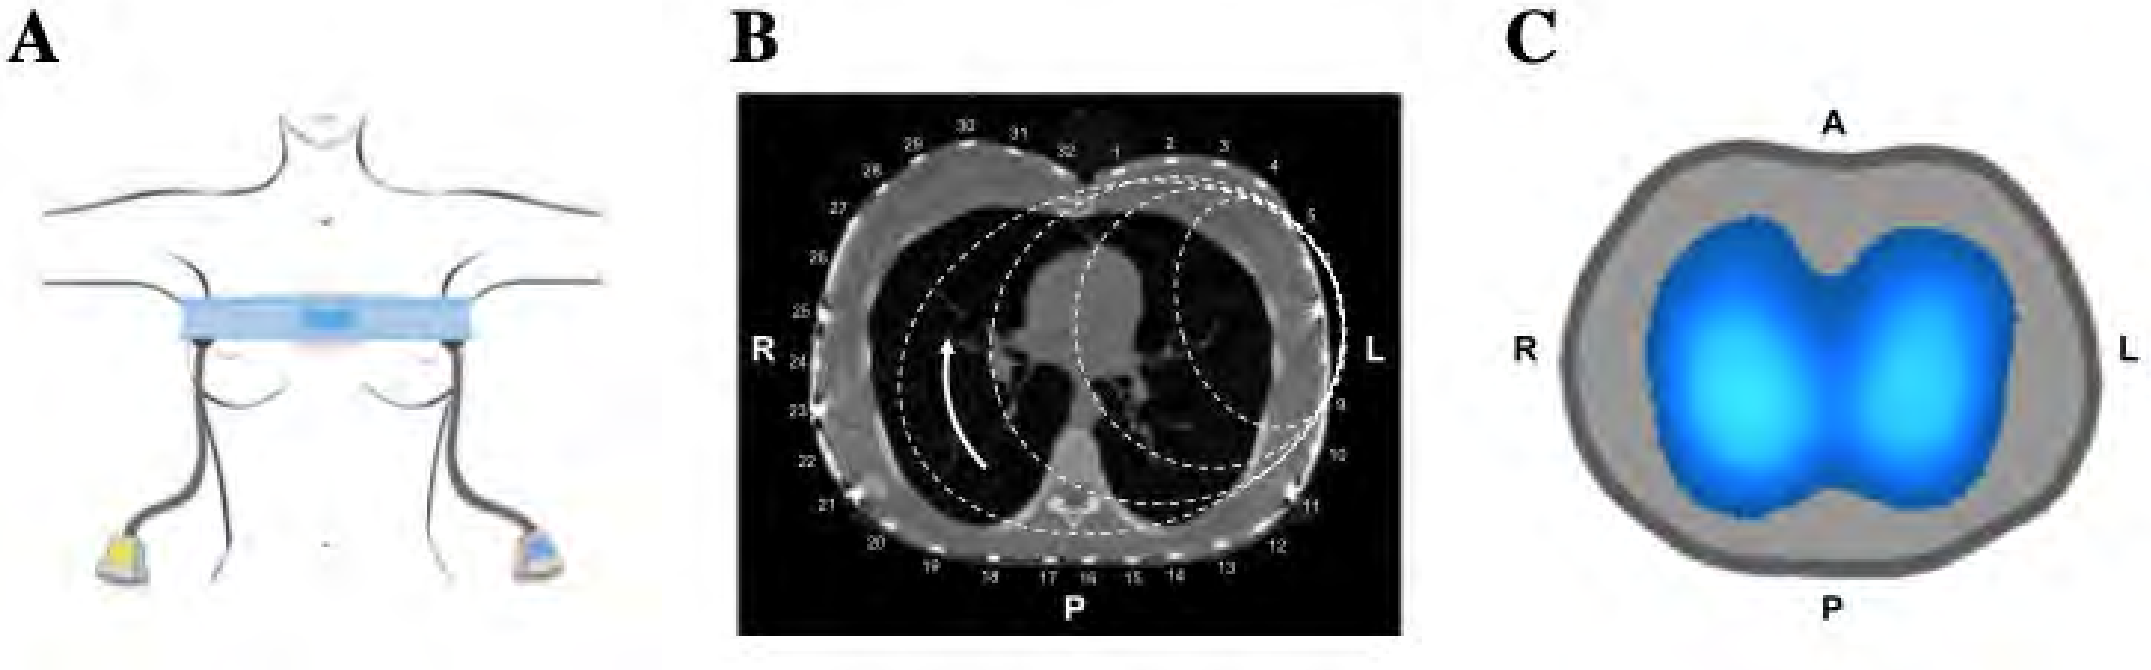
**Bachmann et al. Crit Care 2018.**

Pubmed (EIT AND ARDS)



# EIT: general principles

- Noninvasive real-time bedside technology



**Bachmann et al. Crit Care 2018.**

# EIT General principles

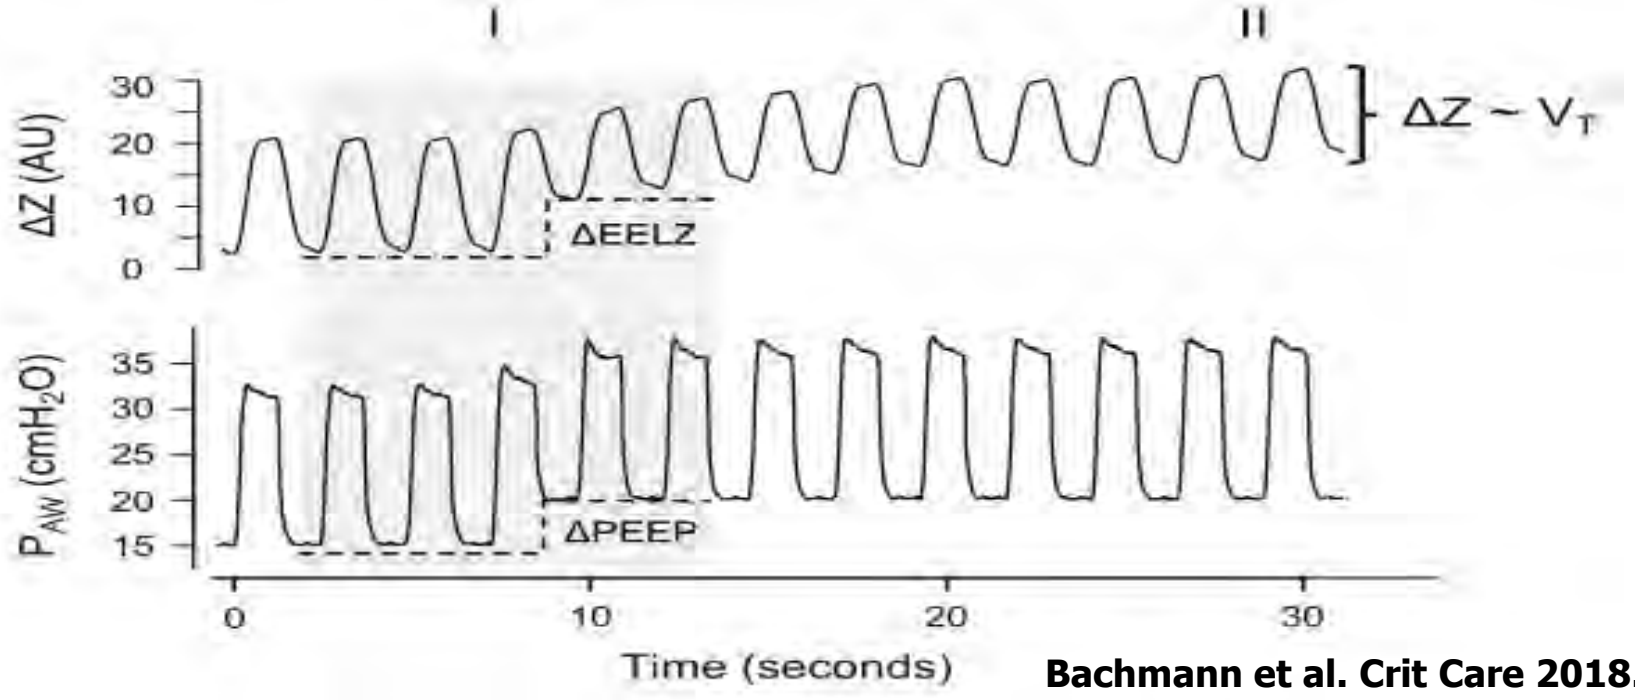
- Every tissue has a different resistivity to current
- Estimates resistivity changes across lungs while breathing
  - Inspiration= ⬆️ Resistivity
  - Expiration= ⬇️ Resistivity

**Table 2** Body tissue resistivity to passage of current (50 Hz)

| Tissue | Resistivity (Ωm) |
|---|---|
| Lung during expiration | 12.5 |
| Lung during inspiration | 25 |
| Blood (50% hematocrit) | 1.4–1.7 |
| Cardiac muscle | 2.5–5 |

**Tomicic V and Cornejo R. Journal of Thoracic Disease, 2019**

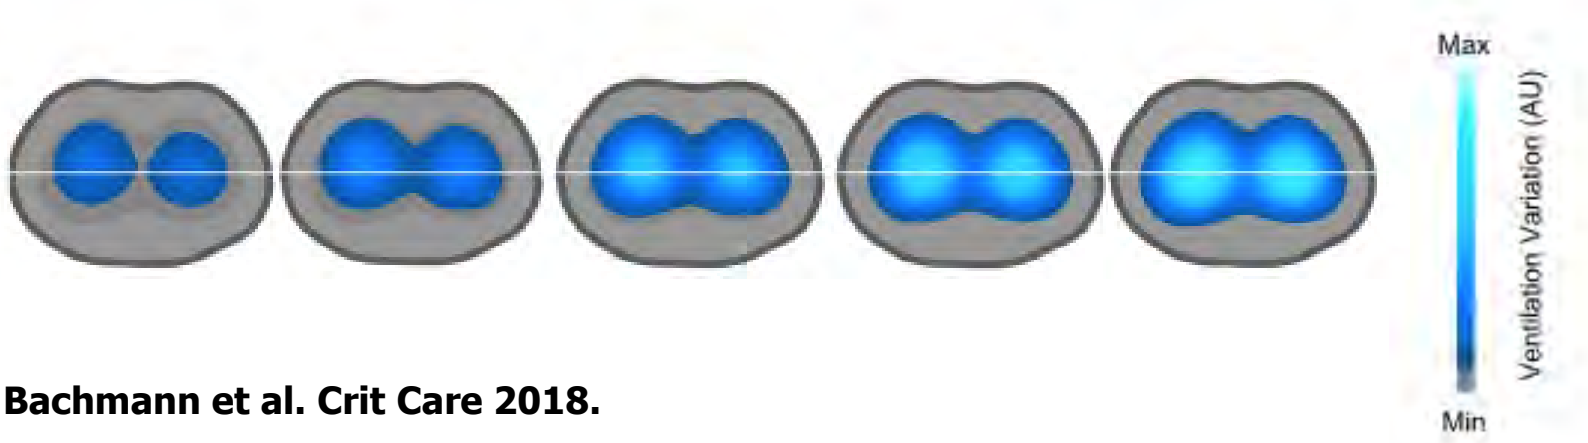
EIT plethysmogram



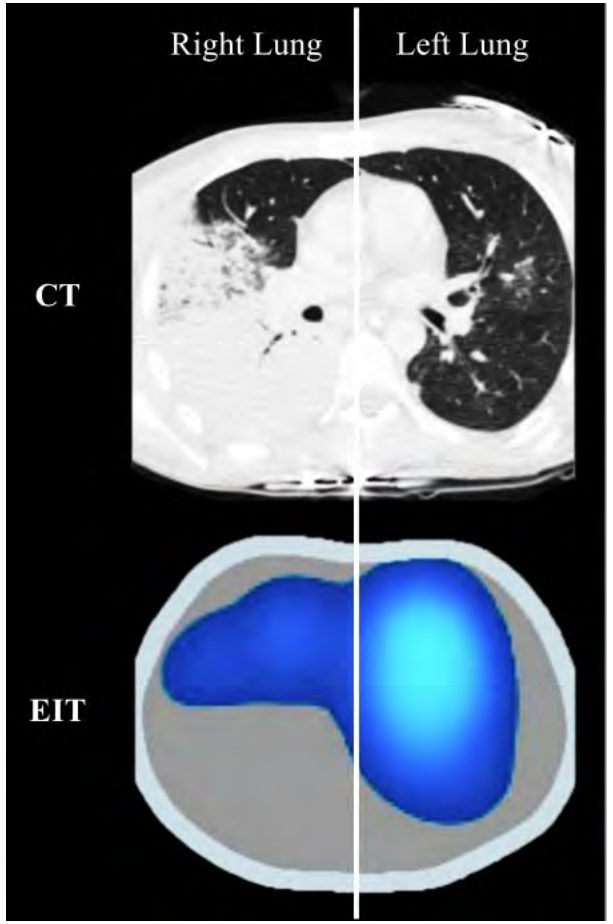
**Bachmann et al. Crit Care 2018.**

# EIT: General principles

- Resistivity/change in resistivity correlates with volume of air that enters the lung
- Creates image and way to quantify/assess distribution of ventilation



**Bachmann et al. Crit Care 2018.**

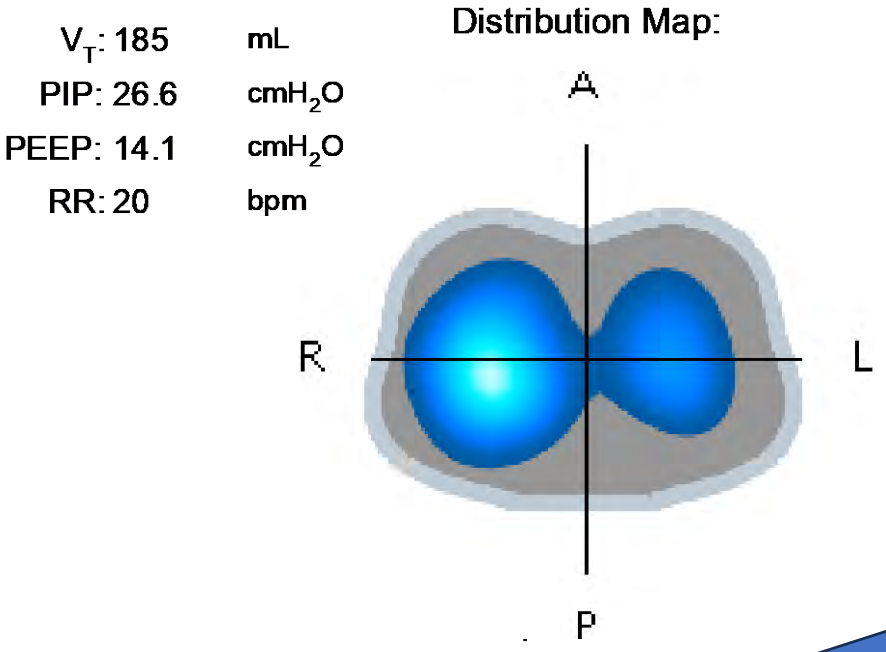


**Bachmann et al. Crit Care 2018.**

# Clinical/Research Applications

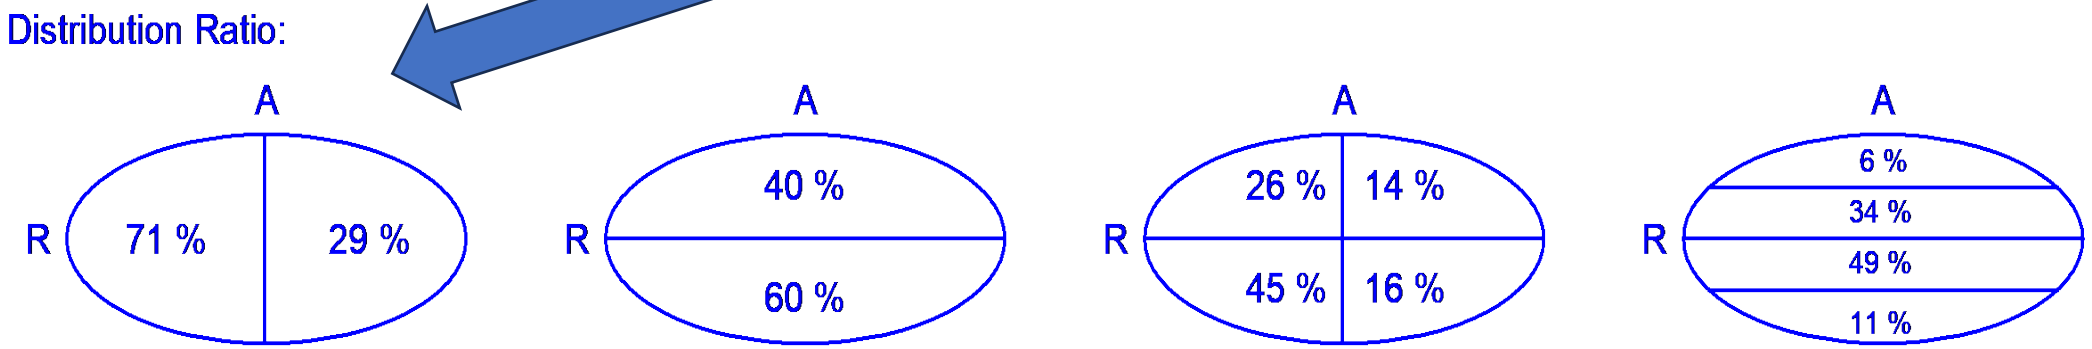
- Distribution of ventilation
- PEEP titration
- Pendelluft
- Other: patient-ventilator asynchrony, Ventilation/perfusion, NIPPV

# Distribution of Ventilation



- EIT provides a ventilation map: can quantify distribution of ventilation several ways
- Can use to identify heterogeneity in distribution of ventilation
-Impedance change correlates with changes in air content

Example of mucus plugging on the left side

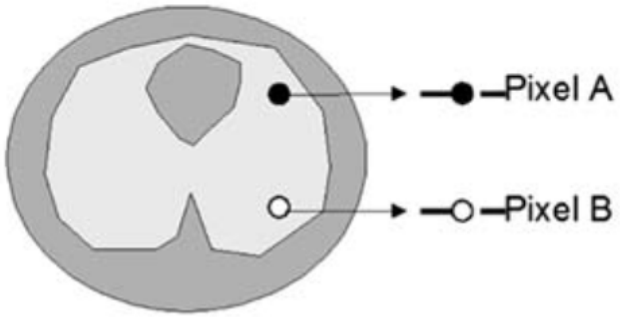


# PEEP Titration

- How should we titrate PEEP?
  - Esophageal manometry: EP-VENT3 planning in progress= TBD
  - PEEP tables?
  - Best compliance?
  - WHO KNOWS?
  - What about EIT?

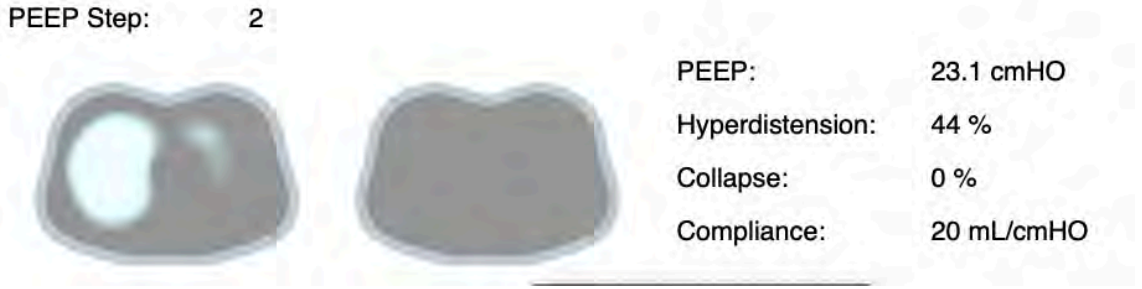
# PEEP Titration with EIT

Balance between overdistension and collapse (Costa Method)



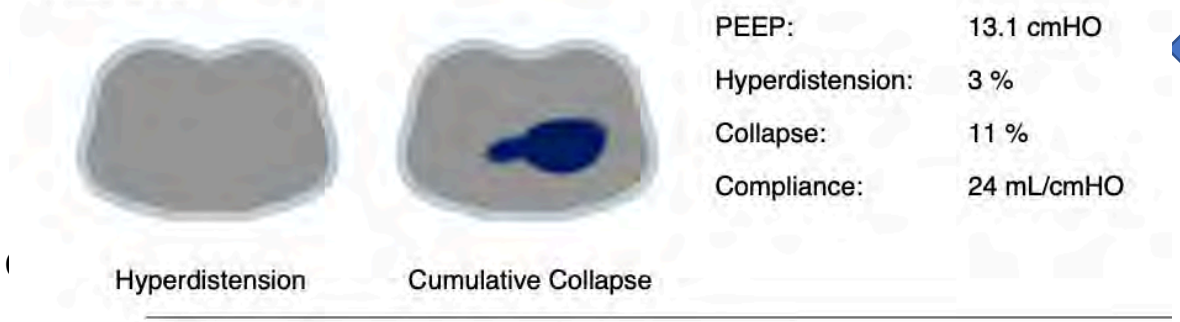
**Costa EL et al. Intensive Care Medicine 2009.**

**PEEP 25**



**PEEP 23**

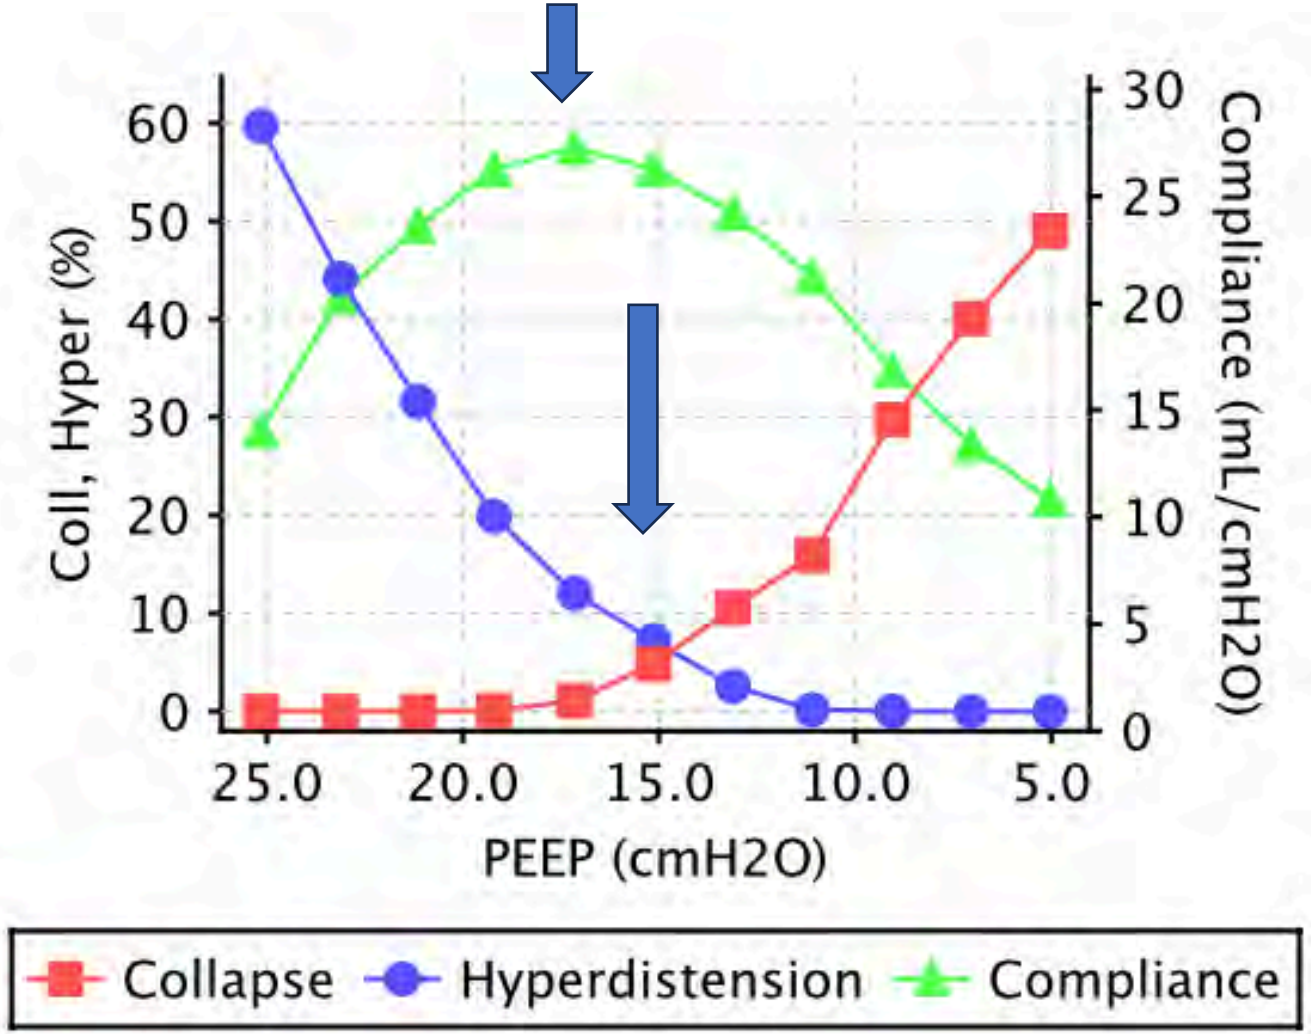
**PEEP 15**



**PEEP 13**

White= overdistention
**Blue**=collapse

# PEEP Titration (example)



| PEEP ($cmH_2O$) | Compliance ($mL/cmH_2O$) | Hyperdist. (%) | Collapse (%) |
|---|---|---|---|
| 25.1 | 14 | 60 | 0 |
| 23.1 | 20 | 44 | 0 |
| 21.1 | 24 | 32 | 0 |
| 19.2 | 26 | 20 | 0 |
| 17.2 | 27 | 12 | 1 |
| 15.1 | 26 | 7 | 5 |
| 13.1 | 24 | 3 | 11 |
| 11.1 | 21 | 0 | 16 |
| 9.0 | 17 | 0 | 30 |
| 7.0 | 13 | 0 | 40 |
| 5.0 | 11 | 0 | 49 |

# PEEP Titration with EIT offers individualized approach and may improve outcomes?

**RECRUIT study (2023): Jonkman and Alcala et al. *AJRCCM***

- 171 Patients with ARDS due to COVID-19
- Used EIT based PEEP selection (Costa method) versus best compliance
- in 81% of patients EIT based PEEP selection yielded PEEP selection different from best compliance
- Offers personalized way to adjust PEEP in patients with different responses to PEEP

*Non COVID recruitment ongoing

**EIT-Guided PEEP titration reduces mechanical power: a randomized crossover pilot study (2023): Jimenez et al. *Critical Care***

- High PEEP/FiO2 table versus EIT guided PEEP selection
- 16 patients with moderate to severe ARDS
- EIT guided PEEP titration resulted in lower mechanical power

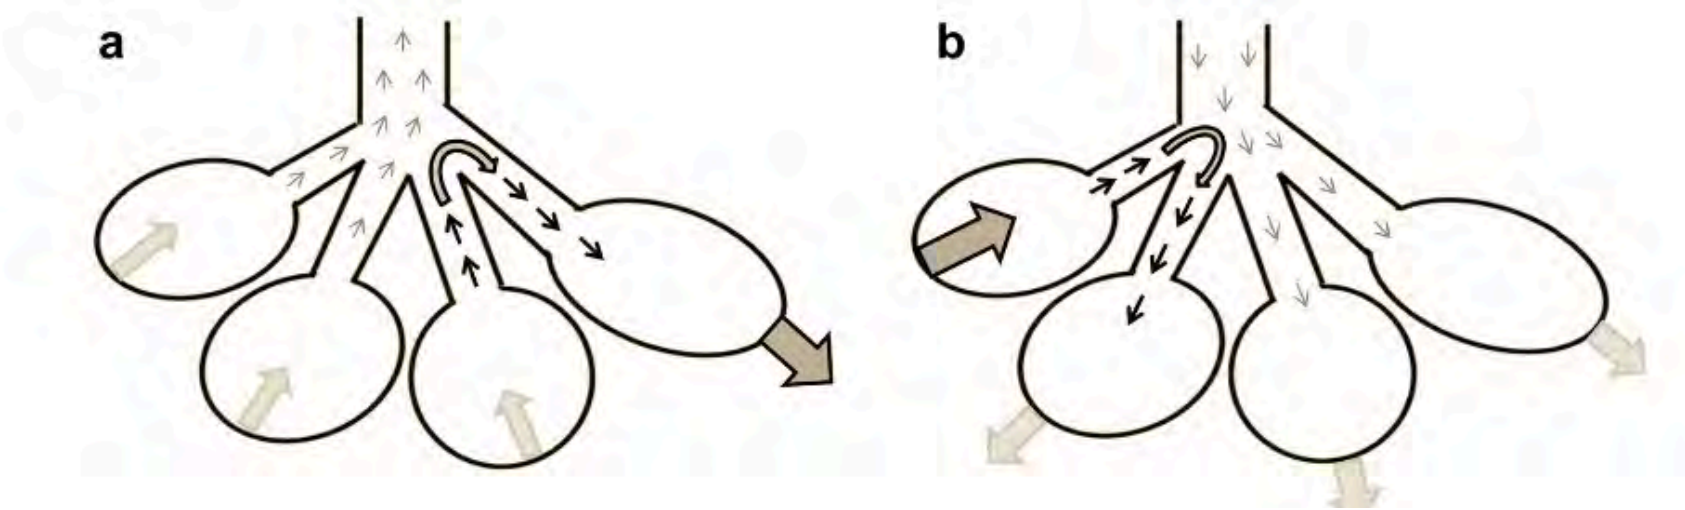
**Early Individualized PEEP guided by EIT in ARDS: a randomized controlled clinical trial (2021): He et al. *Critical Care***

- ARDS net PEEP/FiO2 table versus EIT guided PEEP selection
- 117 patients with moderate to severe ARDS
- Absolute mortality 27% (PEEP/FiO2 table) versus 21% (EIT guided)

**Additional EIT studies upcoming**

# Pendelluft

General definition: movement of air from one region of the lung to another during a tidal breath



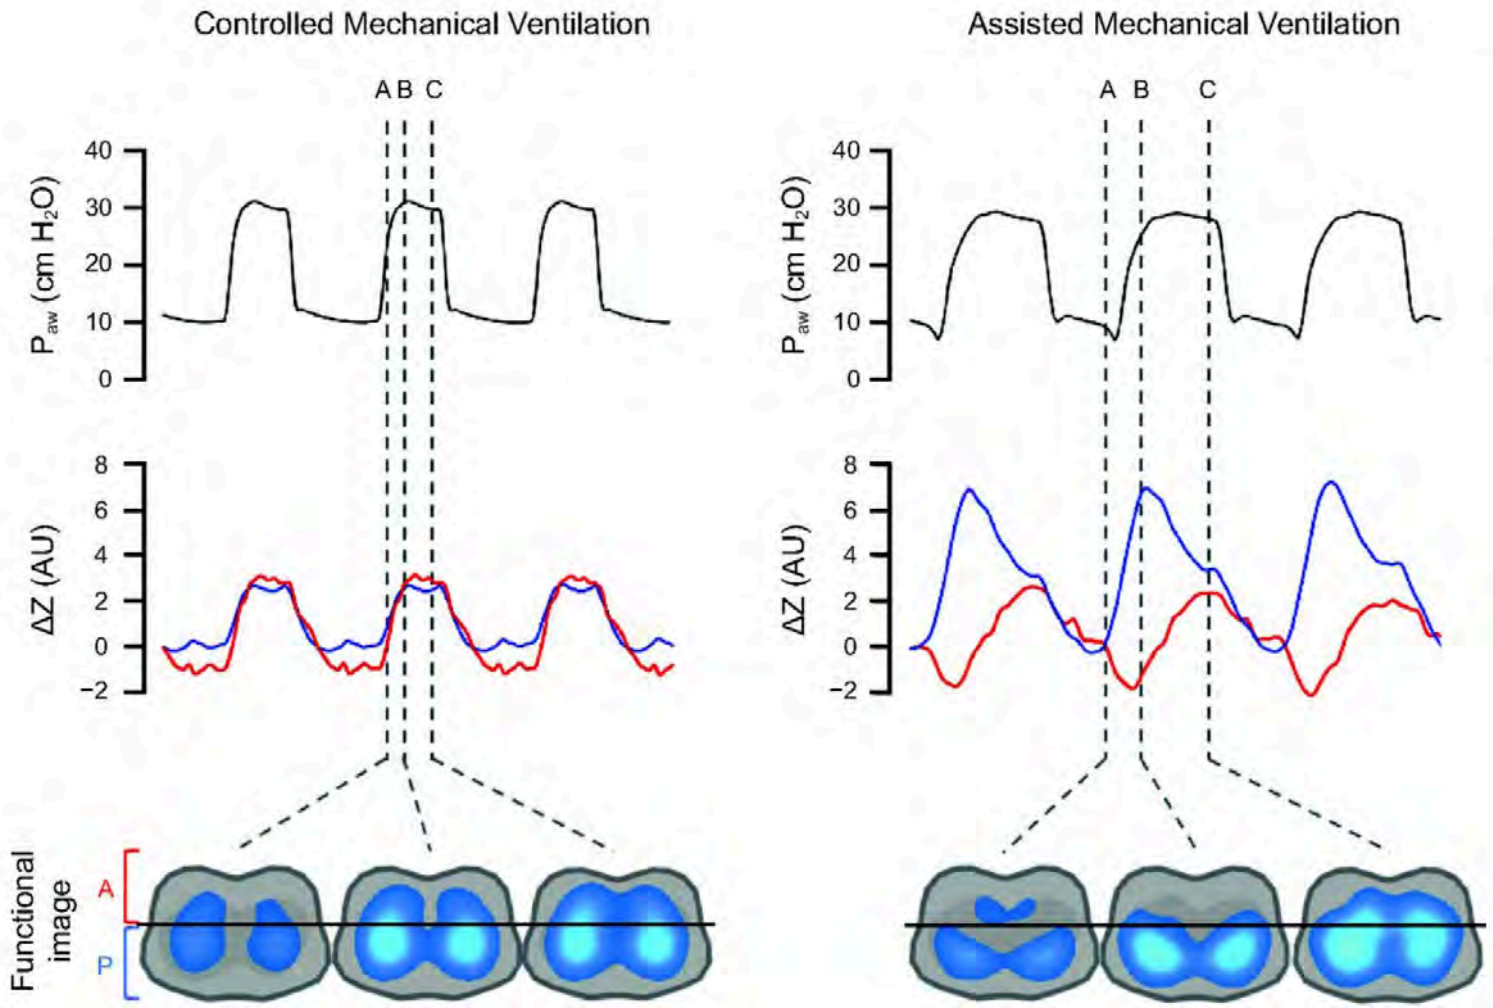
- Can lead to occult overdistension (potentially harmful)

**Coppadoro A et al. Occurrence of pendelluft under pressure support ventilation in patients who failed a spontaneous breathing trial: an observational study.** ***Ann Intensive Care*** **2020.**

# Pendelluft

- EIT can be used to identify pendelluft

* Can use NMB or increase PEEP to minimize pendelluft



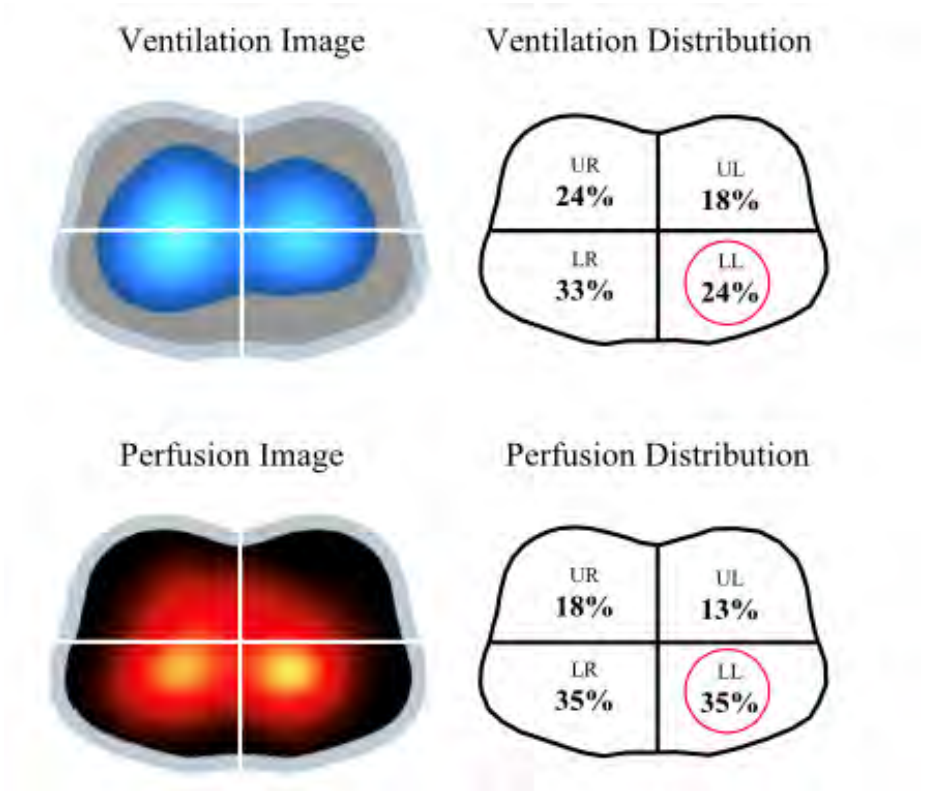
**Kacmarek R et al. Consequences to the Lungs When Gas Swings Between Lung Units during Patient triggered mechanical ventilation.** ***Respiratory Care*** **2021.**

# Future Directions

- Ventilation/perfusion mapping

- Asynchrony detection features

- HHFB, NIPPV, HFOV (measuring tidal volume, collapse/overdistention)



**Bachmann et al. Crit Care 2018.**

# Take home messages

- EIT offers a continuous non-invasive bedside assessment of regional ventilation (and perfusion)
- Offers good temporal resolution; can see dynamic changes over time
- Can measure responses to changes like PEEP or paralytics
- Allows individualized patient management (when one-size fits all approaches have failed)
- Ongoing research will determine impact on clinical outcomes

# Thank you!

- Special thank you to....
  - Marcelo Amato
  - Eduardo Costa
  - Caio Morais
  - Glasiele C. Alcala
  - Ewan Goligher
  - Atul Malhotra
  - Kim Prisk
  - Jim Butler
  - Stephen Loring

# Pro: Non-Ventilator Based Techniques are Necessary for Optimization of Lung Mechanics in Ventilated Patients?

**Brian M. Daniel, RRT, TCO**
**Respiratory Therapist**
**UC San Francisco**

Brian M. Daniel is a respiratory care practitioner with more than 35 years of experience in academic health care, education, and research. Currently, he is a clinical specialist for Respiratory Care Services at UCSF Health as well as a clinical research coordinator for UCSF's Cardiovascular Research Institute. Brian also serves as Director for Clinical Education, at Skyline College's Respiratory Care Program.

# Let’s NOT forget the basics!

Non-Ventilator based techniques ARE necessary when optimizing lung mechanics…

Diaphoresis and nasal flaring indicate increased patient effort
Cyanosis is not a reliable physical sign
Tachypnea determined over the course of a full minute is a sensitive sign of failure
Paradoxical motion of the abdomen is also evidence of increased patient effort
Heightened sternomastoid activity is evidence of increased patient effort
Recession may be seen in the suprasternal and supra-clavicular spaces
Intercostal space recession also indicates increased patient effort
Tachycardia is an indicator of severe cardio-pulmonary distress

**Causes, clinical features, and management of respiratory distress in mechanically ventilated patients**

| Etiology of respiratory distress | Clinical features, ventilator mechanics, bedside testing | Treatment |
|---|---|---|
| **Ventilator and ventilator circuit** | | |
| Incorrect ventilator settings (eg, tidal volume, fraction of inspired oxygen, inspiratory flow or pressure rate, positive end expiratory pressure, trigger sensitivity) | ▪ Can occur when settings are inadequate or too high.<br>▪ Commonly found when ventilator settings are initiated or changed (eg, after intubation, procedures, or transport).<br>▪ May be less common with modern ventilators that automatically revert to previous settings when patients are temporarily removed from mechanical ventilation or settings are temporarily changed. | ▪ Disconnect the ventilator from the ETT.<br>▪ If respiratory distress resolves, examine the ventilator including settings and connections for problems.<br>▪ Once resolved, resume mechanical ventilation.<br>▪ If distress recurs, consider altering ventilator settings attempting to "match" patient effort (eg, increase the tidal volume or respiratory rate or switch to pressure support or pressure-controlled mode), ensuring new settings do not place the patient at risk of volutrauma or barotrauma.<br>▪ Consider replacement of the ventilator if distress persists. |
| Ventilator circuit leak or obstruction (including HME) | ▪ Volume-controlled ventilation:<br>• Low peak pressures and low expired tidal volume may suggest a leak in the absence of a balloon cuff leak or cephalad displacement of the ETT (refer to below).<br>• High peak pressures, with widened delta Ppeak-Pplat*, may suggest obstruction.<br>▪ Pressure-controlled ventilation:<br>• Airway pressure unchanged, increase in tidal volume, and expiratory flow that does not return to baseline may suggest an air leak.<br>• Airway pressure unchanged, a decrease in tidal volume, and expiratory flow that is slow to return to baseline, suggest increased airway resistance from obstruction.<br>▪ A sawtooth pattern on ventilator graphics may suggest secretions or water in ventilator tubing as a source of obstruction.<br>▪ If no secretions are present in ventilator tubing, consider an obstruction at the level of the HME. | ▪ Replace the tubing if a leak is suspected.<br>▪ Empty the ventilator tubing of secretions.<br>▪ Replace the HME, if necessary. |
| Ventilator malfunction | ▪ This issue is unusual but may be suspected when respiratory distress recurs despite resuming ventilation with the correct settings and no intrinsic parenchymal, airway, pleural, or extrapulmonary issues are suspected. May be determined during ventilator interrogation. | ▪ Consider replacing components of the ventilator or the ventilator itself. |
| **Airway** | | |
| | ▪ **Most conditions are associated with the following ventilatory mechanics:**<br>• Increased Ppeak and a widened delta Ppeak-Pplat (volume-controlled ventilation).*<br>**or**<br>• Unchanged airway pressure, decreased tidal volume, expiratory flow slow to return to baseline (pressure-controlled ventilation). | |
| ETT obstruction – Mucus, blood, foreign body, kinking, or biting | ▪ Known thick and voluminous secretions or hemoptysis.<br>▪ Foreign body such as a tooth may have been inhaled during intubation.<br>▪ Kinking in the ETT or biting may be obvious.<br>▪ Resistance to manual ventilation and passage of a suction catheter through the ETT.<br>▪ Maintenance of tidal volume, unless obstruction is complete. | ▪ Attempt to identify and remove the obstruction.<br>▪ Suctioning thick secretions often sufficient.<br>▪ Reposition the head especially if a kinked tube is suspected.<br>▪ Place bite block if biting of the ETT is suspected.<br>▪ If above measures fail, replace ETT.<br>▪ Bronchoscopy if problem persists. |
| Bronchospasm | ▪ Often occurs in those with underlying obstructive lung disease but can also occur due to trauma in the airways (eg, suctioning, bronchoscopy), or medications (eg, beta blockers, allergies).<br>▪ Respiratory distress with wheeze or rhonchi.<br>▪ Maintenance of tidal volume. | ▪ Urgent bronchodilation with beta-2 agonists.<br>▪ Glucocorticoids, antihistamine, histamine receptor blockade, and epinephrine and may be administered if allergy is suspected. |
| Obstruction of lower airways by secretions, blood, airway mass, or foreign object | ▪ Secretions of blood may be evident.<br>▪ Respiratory distress with wheeze or rhonchi (may be unilateral or focal).<br>▪ Tidal volume is maintained. Increased Ppeak* with widened delta Ppeak-Pplat.* | ▪ Attempt suctioning.<br>▪ Saline bullets sometime required to break up thick mucus plugs.<br>▪ Urgent bronchoscopy may be needed for foreign body retrieval, preferably with adequate suction channel and the ability to retrieve a foreign body if necessary. |
| Caudal migration of the ETT to mainstem bronchus (typically right-sided) | ▪ Suspect in patients with agitation or in patients who have been repositioned.<br>▪ Air entry may be limited on the unaffected side and trachea may deviate away from the affected side. | ▪ Deflate the cuff and pull the ETT back by a predetermined amount.<br>▪ Re-image with chest radiography to confirm appropriate placement. |

# Summary

- Basic (non-ventilator based) patient assessment is essential when optimizing lung mechanics.

- Emerging mechanical ventilator tools and adjuncts lack significant evidence and consistency.

# Con: Non-Ventilator Based Techniques are NOT Necessary for Optimization of Lung Mechanics in Ventilated Patients?

**Pablo Gonzalez, RRT**
**Respiratory Therapist**
**Scripps Health**

Pablo Gonzalez is currently a neonatal/pediatric/adult respiratory therapist at Scripps Memorial Hospital in La Jolla, San Diego, CA.

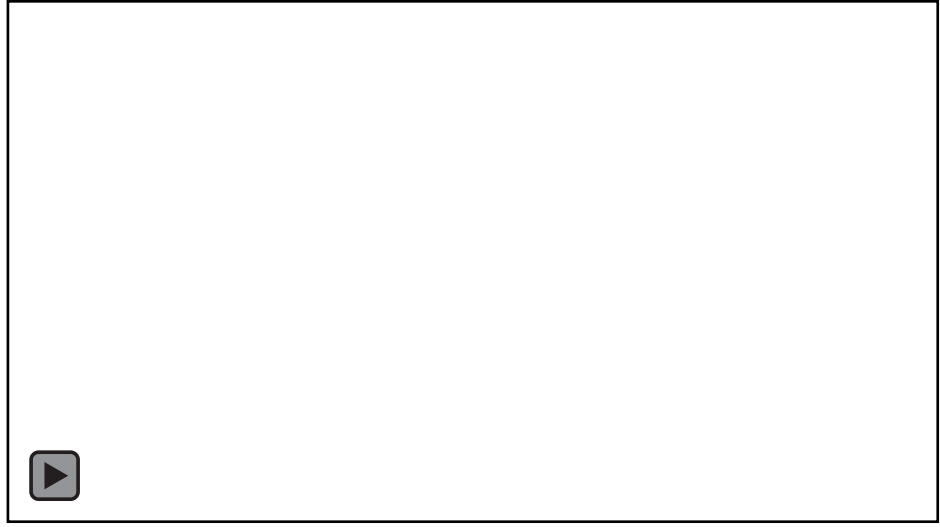
He has worked at a few facilitates: Cedar Sinai Medical Center, CHOC, Loma Linda, Sharp Mary Birch, Sanford MN, and Regions Hospital in St Paul MN where he worked alongside Dr. John J. Marini which drove him to work at the Mayo Clinic and worked alongside Dr. Gustavo Cortes Puentes and worked along renowned physicians/nurses and respiratory therapist as a ECMO specialist.

While he worked at the renowned Mayo Clinic in Rochester Minnesota, St. Mary's Hospital in the CVICU. He was a clinical preceptor, utilizing the advanced modalities in respiratory care, from ventilator management and ventilator waveform management, esophageal balloon monitoring, APRV, caring for ECMO patients, A-line insertion, bladder pressure monitoring, and HFJV in the neonatal population to name a few.

He has continued development of his skills and has started the Advanced Mechanical Ventilation Conference in San Diego. Bringing renowned speakers from all over the world. Currently he is working on a respiratory book that will help clinicians in the ICU.

Pablo earned a B.A. from laguna College of Art and Design in Laguna Beach, CA., and his associate science from California College San Diego.

# “Ventilating Blindly
# The Cons of External Tools”



**My own religion has been to do all the good I could to my fellow man, and as little harm as possible.”**

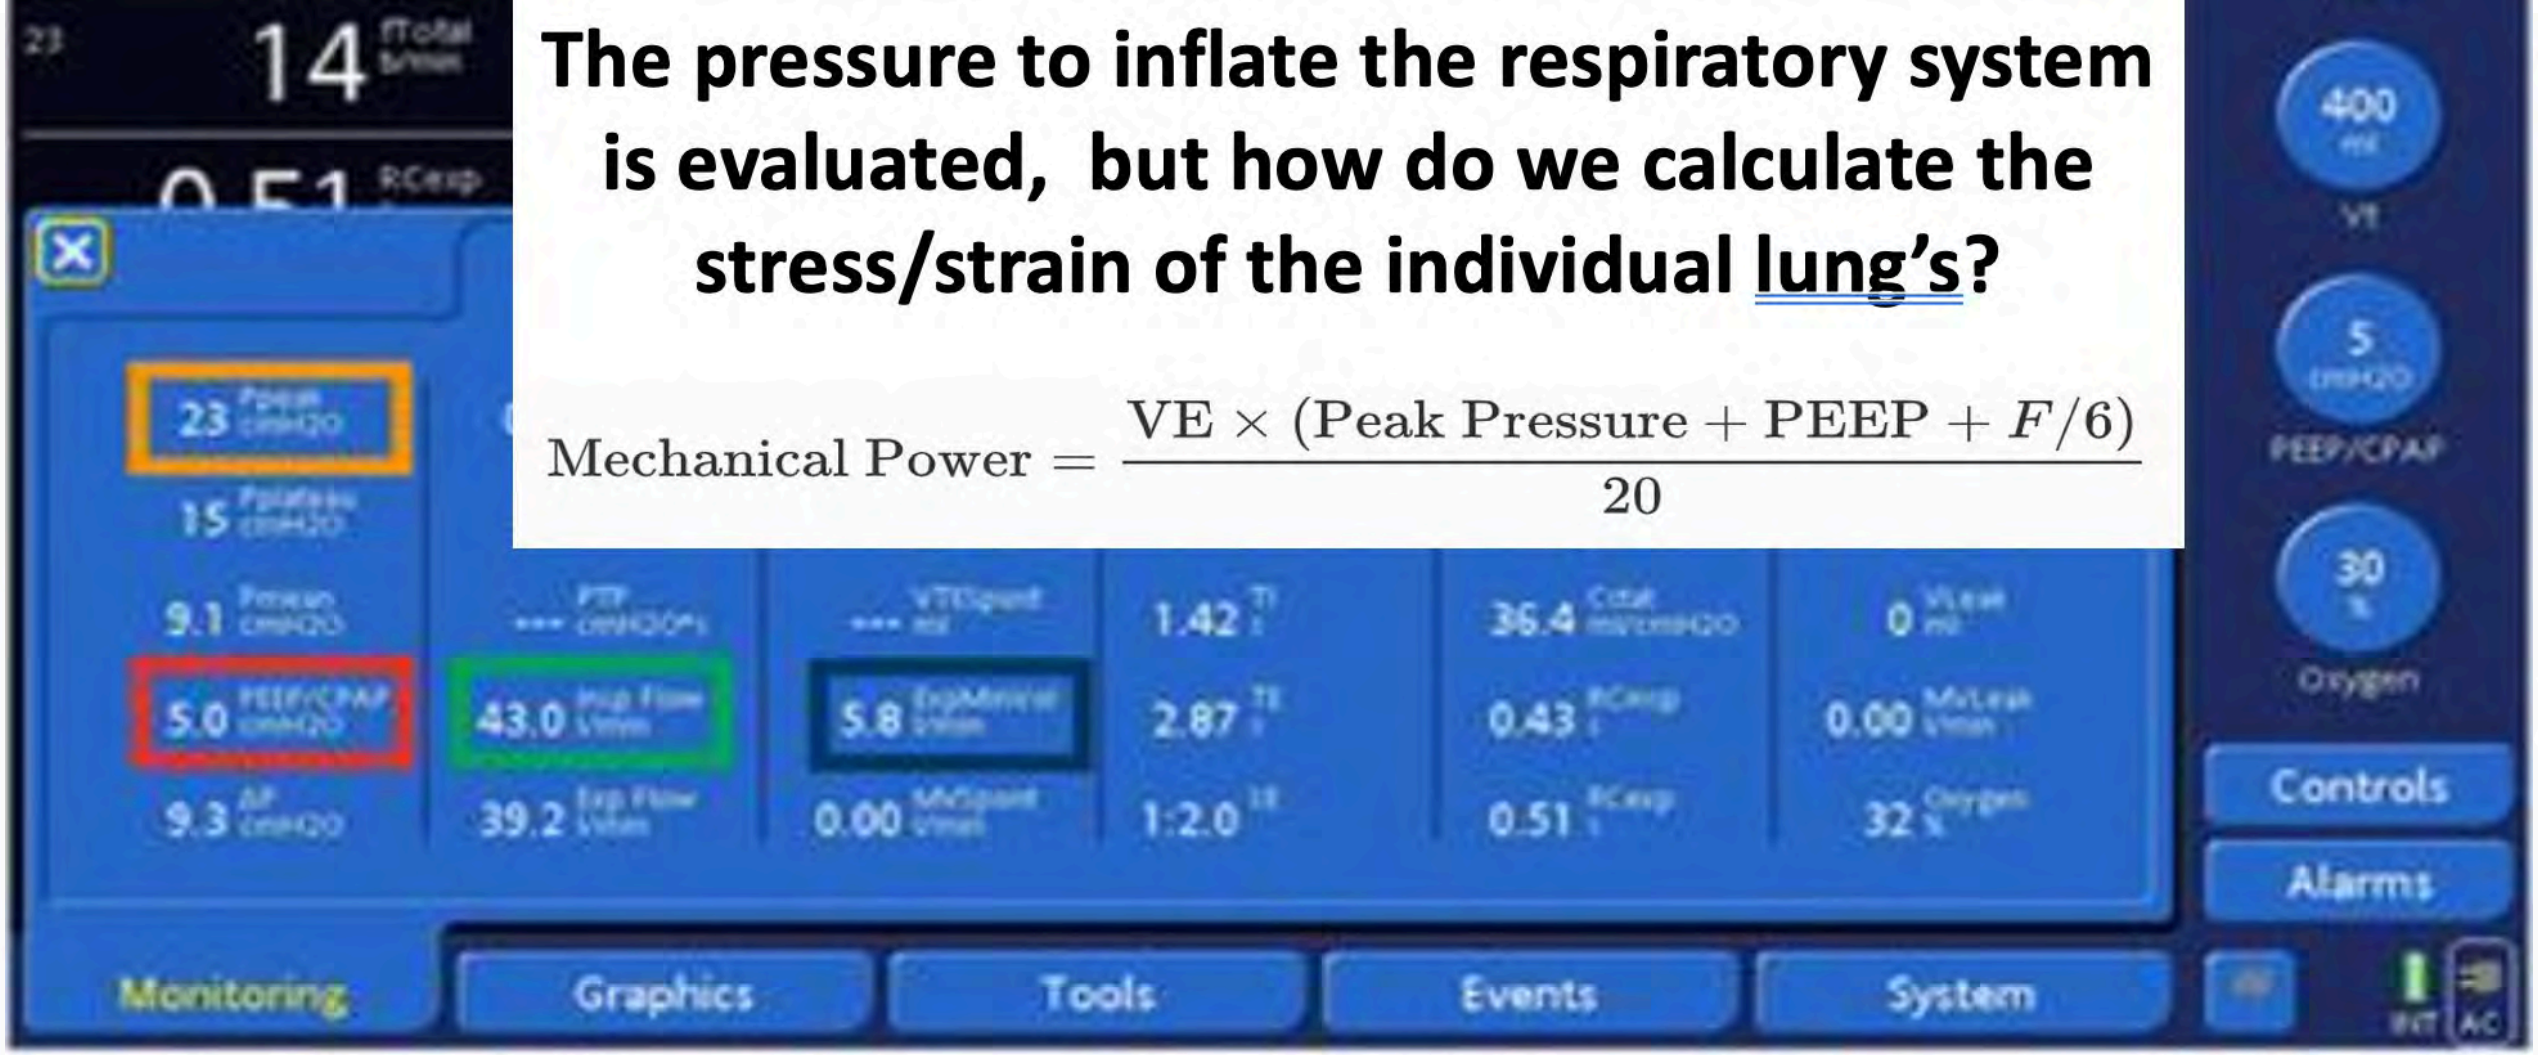
- Dynamic deltaPL= deltaPaw – [2/3 x deltaPocc] (<13-15 cmH2O)
- **Expiratory hold during APRV will give you totalPEEP (do not do this on Drager vents)*
- **Note-Without an Esophageal Balloon Monitoring device, driving pressure is an estimating number ±3-4 cmH2O when compared with a true PL.*



$$\frac{5.8 \times (23 + 5 + 43/6)}{20} = 10.2 \text{ J/min}$$ Mechanical Power in Volume Control

(Mode PC) MP J/min= 0.098xRRxVTx( DeltaP + totalPEEP)

Giosa, L., Busana, M., Pasticci, I. *et al.* Mechanical power at a glance: a simple surrogate for volume-controlled ventilation. *ICMx* **7**, 61 (2019). https://doi.org/10.1186/s40635-019-0276-8

# Mechanical Power in the Setting of Positive End-Expiratory Pressure (PEEP) Titrated by Esophageal Pressure

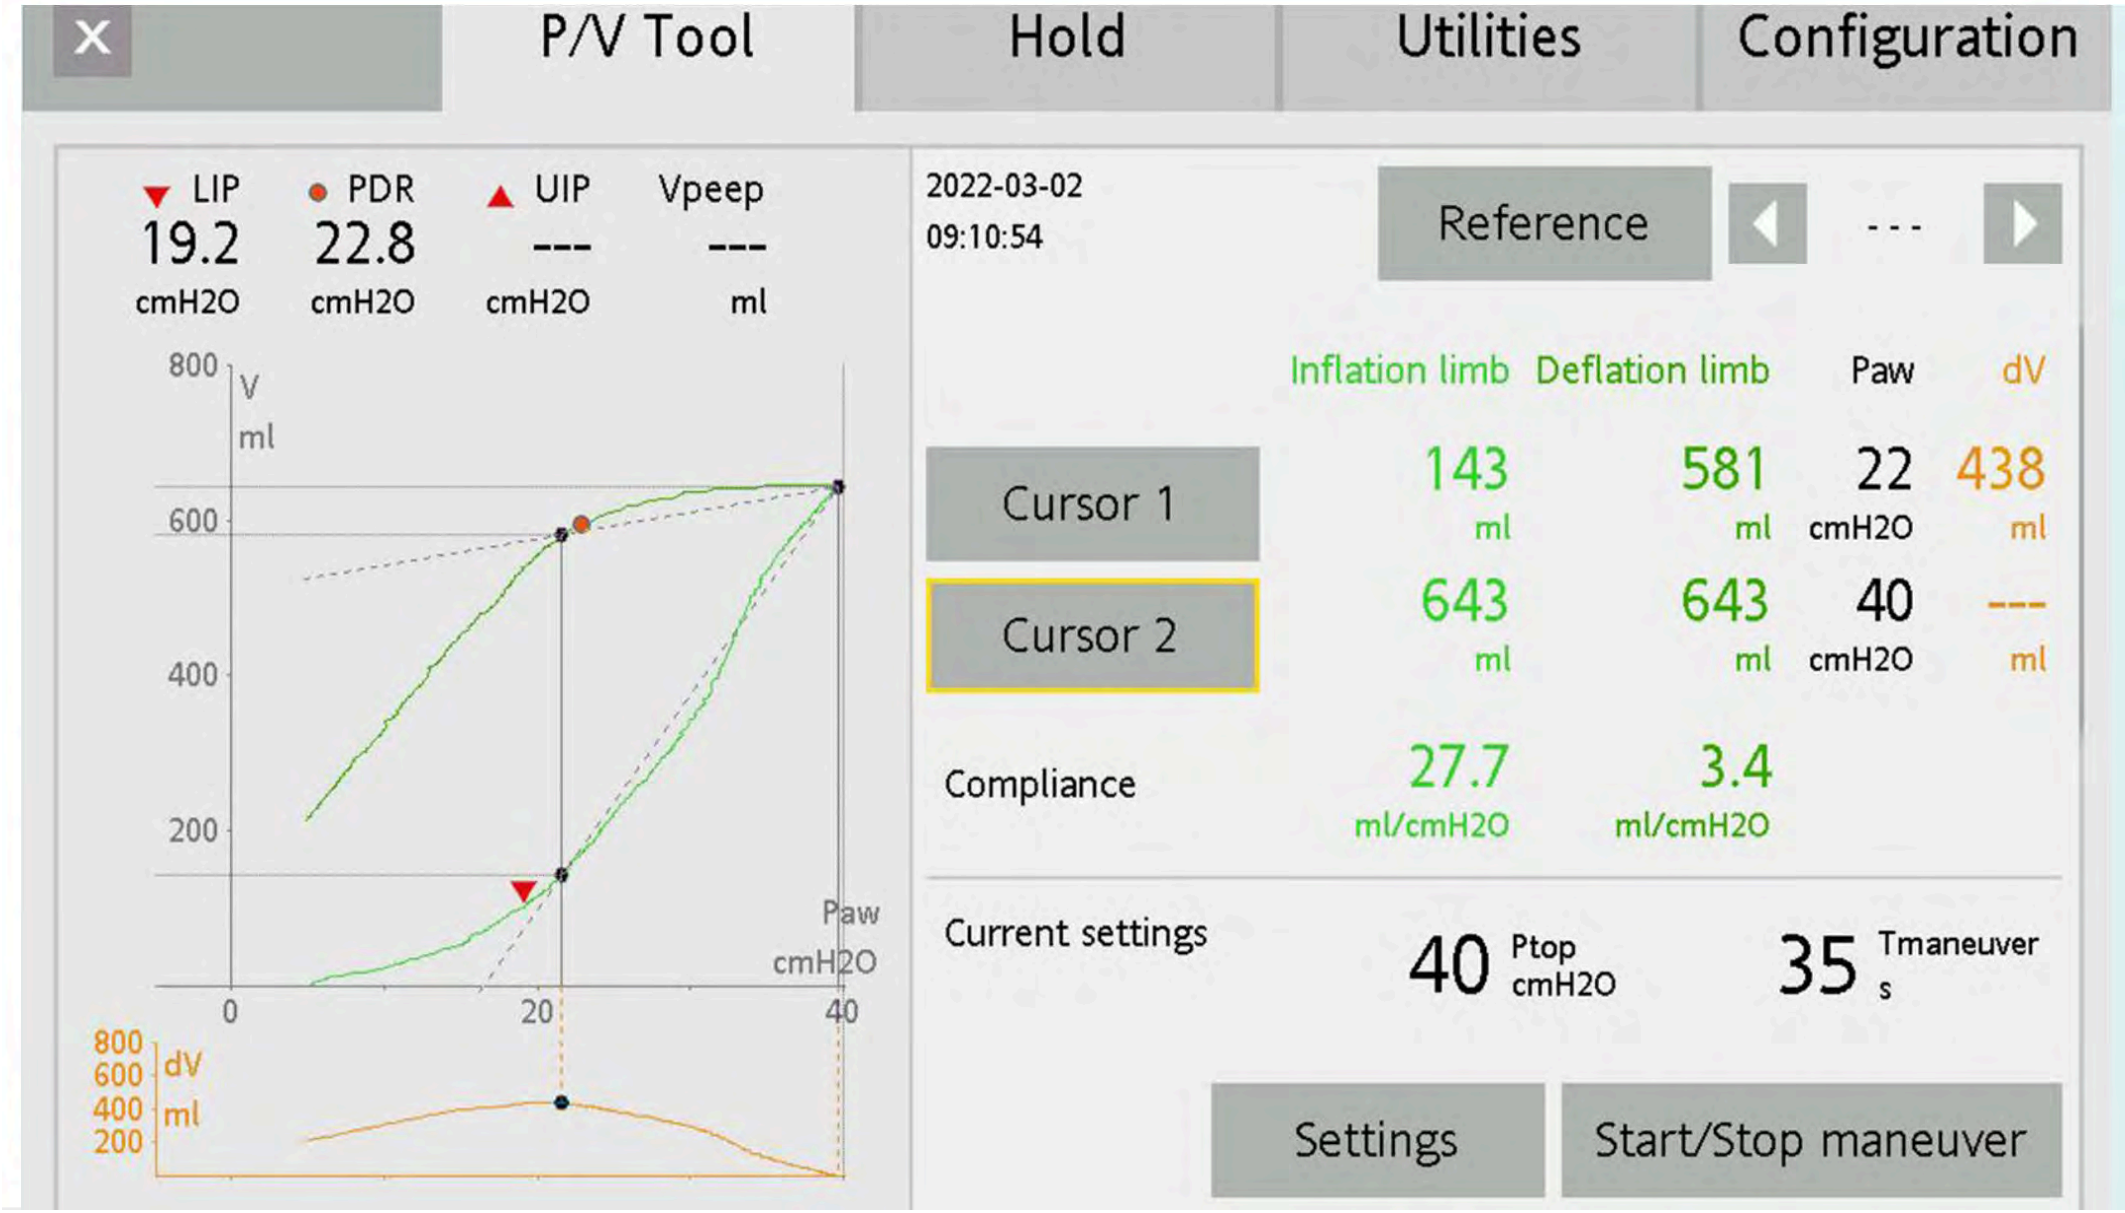
**CONCLUSIONS:**

In our study sample, mechanical ventilation with PEEP titrated by esophageal pressure monitoring resulted in unexpectedly high values of PEEP among patients with mild ARDS. Additionally, both $MP_{RS}$ and $MP_{L}$ seemed to track the higher mortality rate observed in the moderate ARDS group.

Cortes-Puentes GA, Oeckler RA. ATS 2018

MAYO CLINIC

# What is the local volume distribution? Using pressure-volume curves to set proper PEEP in acute lung injury



Nurs Crit Care 2007 Sep-Oct;12(5):231-41. doi: 10.1111/j.14785153.2007.00224.x.

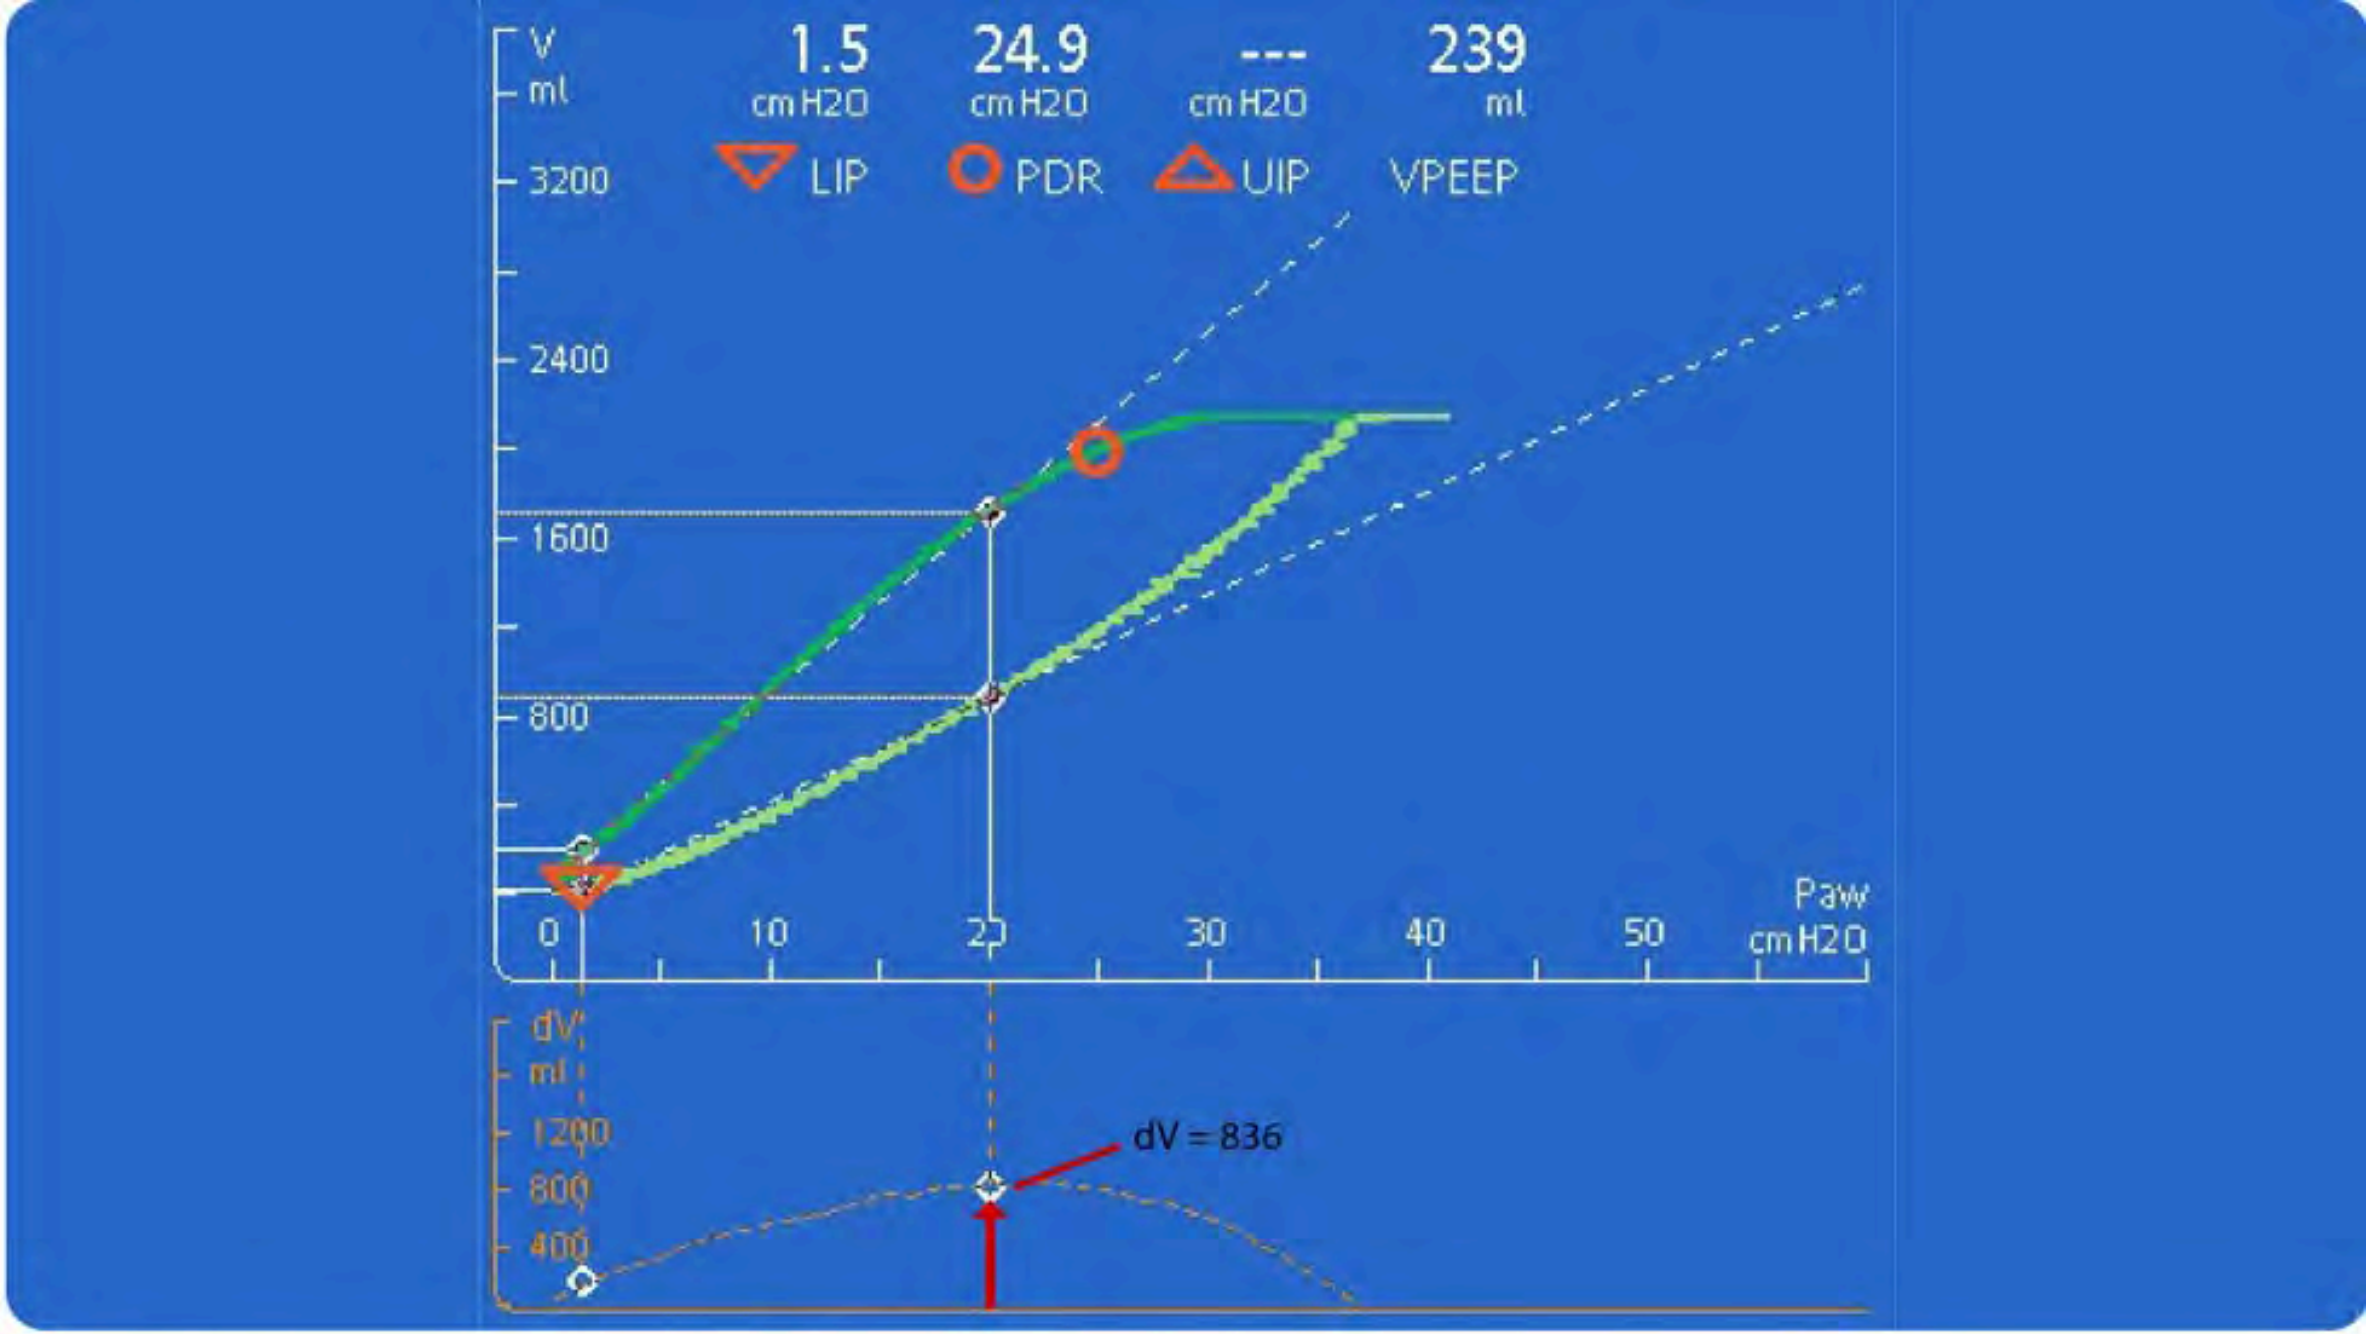


Figure 4: Difference > 500 ml - high potential for recruitment

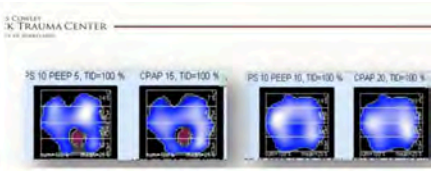
## Electrical Impedance Tomography (EIT)

**Pros**

- EIT is noninvasive, radiation-free monitoring tool to assess and visualize regional ventilation and perfusion.
- EIT is currently predominantly a research tool, but rapidly emerging data are helping to define its clinical role.
- EIT may prove to be a key component of a multimodal approach to individualizing ventilator management, as has been demonstrated by the Lung Rescue Team (MGH).

**Cons**

- >60 BMI: larger belt in development
- Implanted electronic devices (neurostimulators, cardioverter defibrillators or pacemakers)
- Pregnant or lactating patients
- Fragile skin, spinal cord injury (e.g. Burns)

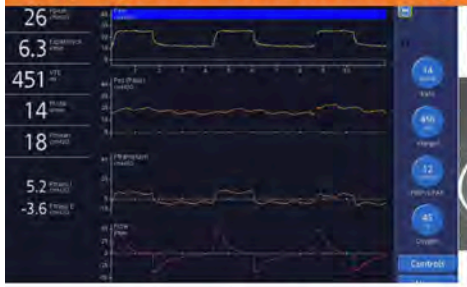


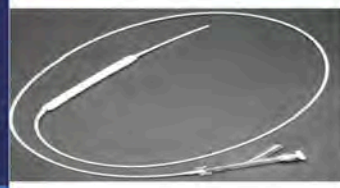
| PS 10 cm H2O + PEEP 5 cm H2O | CPAP 15 cm H2O + ATC | RESULTS | | PS 10 cm H2O + PEEP 10 cm H2O | CPAP 20 cm H2O + ATC |
|---|---|---|---|---|---|
| 14% | 7% | Decreased by 15% | Ventral | 14% | 20% |
| 51% | 43% | | Mid-Ventral | 40% | 37% |
| 26% | 32% | Increased by 13% | Mid-Dorsal | 31% | 38% |
| 10% | 17% | | Dorsal | 15% | 15% |

**Pros**

- The goal of a Pes-based PEEP setting is to have sufficient transpulmonary pressure (PL) to keep (part of) the lung open at the end of expiration.
- EPVent-2 revealed in patients with lower APACHE II score and when PEEP setting resulted in end-expiratory PL values close to 0 ± 2 cmH2O instead of higher or more negative values.
- Calibration of the balloon should be repeated regularly.
- Too low PEEP setting in patients with airway closure will result in misleading respiratory mechanics assessment. Pes readings should always be checked.

## Esophageal Balloon Monitoring





**Cons**

- Excessive secretions
- Enlarge congenital anomalies
- Leakage in chest
- Anomaly in the esophagus
- Pneumonectomy?

*The esophageal balloon for respiratory monitoring in ventilated patients:* European Respiratory Review 2023 32: 220186; DOI: 10.1183/16000617.0186-2022

**Pros**

- Easy to perform at bedside
- Reflects changes in respiratory muscle output
- Helpful for detecting asynchronies in PSV mode

## Electrical Activity of the Diaphragm (EAdi)

**Cons**

Any condition that limits the respiratory drive or any diaphragmatic anatomical defect in cases of an intact respiratory drive may be contraindicated, including:

1. Central: paralytics, suppressed respiratory drive due to heavy sedation or brain injury
2. Peripheral: phrenic nerve injury or use of paralytic agent
3. Structural: esophageal atresia and diaphragmatic hernia
4. Target values may be difficult to achieve in patients with excessive respiratory drive

Foti G., Cereda M., Banfi G., Pelosi P., Pesenti A. End-inspiratory airway occlusion: a method to assess the pressure developed by inspiratory muscles in patients with acute lung injury undergoing pressure support. Am J Respir Crit Care Med. 1997;156(4 Pt 1):1210-1216

# Mortality rate is cut in half by a Lung Rescue Team at Mass General focused on patients with obesity and acute respiratory failure

Debate

patients with obesity and ARF within 24 hours of ICU admission. The intervention tools they employ include esophageal manometry to determine the intrapleural pressure inside the chest; trans-thoracic echocardiography to determine cardiac function during mechanical ventilation manipulation; and electrical impedance tomography (EIT) to measure the regional distribution of ventilation and assess the degree of lung collapse and overdistension.

## Rob Bautista, BSRT, RRT, RRT-ACCS
## Respiratory Therapist
## UC San Francisco

Roberto Bautista received his Baccalaureate Degree from Boise State University and is pursuing his Masters Degree at UCSF. He is a Clinical Specialist for the Respiratory Care Services department at UCSF with a focus on Adult Critical Care. Roberto is the CSRC-AARC Delegate and is a member of the CSRC Executive Committee.

## Lena Scotto, MD
## Assistant Professor
## VA Palo Alto/Stanford

After earning a B.S. from Stanford University, Dr. Scotto attended Johns Hopkins School of Medicine. She then returned to her native Bay Area to train in the combined Stanford University Anesthesiology Residency/Critical Care Fellowship program and served as a Chief Fellow in Critical Care Medicine (CCM). Following graduation, Dr. Scotto worked in private practice at a local hospital as an Anesthesiologist and Intensivist and later joined the Palo Alto VA in 2019 as an Attending in Anesthesiology and Critical Care Medicine. She is the hospital-wide Resuscitation Committee Co-Chair and heads the newly formed Green Anesthesia Committee. Furthermore, she is a member of the Anesthesia Patient Safety Foundation Advisory Group on Perioperative Brain Health. Outside of work, when she's not chasing after her toddler, she enjoys trail running, reading mystery novels, and trying new cooking recipes.

# Esophageal Manometry

**Pablo Gonzalez, RRT**
**Respiratory Therapist**
**Scripps Health**

Pablo Gonzalez is currently a neonatal/pediatric/adult respiratory therapist at Scripps Memorial Hospital in La Jolla, San Diego, CA.

He has worked at a few facilitates: Cedar Sinai Medical Center, CHOC, Loma Linda, Sharp Mary Birch, Sanford MN, and Regions Hospital in St Paul MN where he worked alongside Dr. John J. Marini which drove him to work at the Mayo Clinic and worked alongside Dr. Gustavo Cortes Puentes and worked along renowned physicians/nurses and respiratory therapist as a ECMO specialist.

While he worked at the renowned Mayo Clinic in Rochester Minnesota, St. Mary's Hospital in the CVICU. He was a clinical preceptor, utilizing the advanced modalities in respiratory care, from ventilator management and ventilator waveform management, esophageal balloon monitoring, APRV, caring for ECMO patients, A-line insertion, bladder pressure monitoring, and HFJV in the neonatal population to name a few.

He has continued development of his skills and has started the Advanced Mechanical Ventilation Conference in San Diego. Bringing renowned speakers from all over the world. Currently he is working on a respiratory book that will help clinicians in the ICU.

Pablo earned a B.A. from laguna College of Art and Design in Laguna Beach, CA., and his associate science from California College San Diego.

# Hands-on Session:
# Electrical Impedance Tomography

**Alex Kristine Pearce, MD**
**Associate Physician Diplomate**
**UC San Diego**

Dr. Alex Pearce received her medical degree from Tulane School of Medicine followed by residency in Internal Medicine at UC San Diego. She subsequently completed her clinical fellowship in Pulmonary and Critical Care and research fellowship at UC San Diego. She currently works as an intensivist at UC San Diego with a research focus on mechanical ventilation and Acute Respiratory Distress Syndrome.

# Hands-on Session:
# Portable Bronchoscopy

## Lindsey John, RRT
## Respiratory Therapist
## UC San Francisco

Lindsey John received her Associate of Respiratory Care in 2004 from Milwaukee Area Technical College and Bachelors of Psychology from Trinity International University in Deerfield, IL 2016. Over her 20 year career in Respiratory Care, Ms. John has worked in Level 1 and 3 Trauma Centers, Regional Burn Units, Level 3 NICUs and Critical Care ICUs. Currently, she is the Bronchoscopy Services Manager at UCSF for the Lung Transplant, Interventional Pulmonology and Pulmonary Consult Services.

## Joon Chang, MD
## Assistant Professor
## Stanford University

Dr. Joon Chang received his medical degree from UCLA David Geffen school of medicine. He did her post-graduate medicine residency at NYU and pulmonary and critical care fellowship at Stanford. He completed his interventional pulmonology fellowship at the Hospital of University of Pennsylvania in 2022. Currently, he serves as an Assistant Professor of Medicine at Stanford and a member of interventional pulmonology group at Stanford.

# Single-Use Bronchoscopy Cheat Sheet

Single-Use (Portable) Bronchoscope vs. Reusable Olympus Bronchoscope Considerations

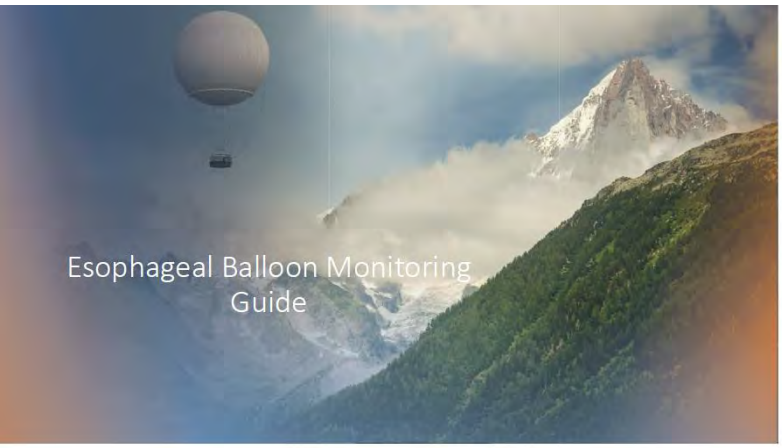
- **Cost** of single use bronchoscope vs. repairing reusable bronchoscope
- Single use vs. sterile **reprocessing** for reusable
- **Workflow**: monitor and tower set up with processor
- **Bronchosampler**- single operator ease of use
- Infection risk
- **Environmental factors** (water, chemical energy)
- Location of working channel

| Single-Use Bronchoscopes | Working Channel Diameter (mm) | Scope Outer Diameter (mm) | Minimum Endotracheal (ET) Tube Size* | |
|---|---|---|---|---|
| Ambu aScope 4 Regular | 2.2 | 5.0 | 6.0 | Bronchosampler Swivel |
| Ambu aScope 4 Large | 2.8 | 5.8 | 7.0 | |
| Ambu aScope 5 Ultra-Thin | 1.2 | 2.7 | 4.0 | |
| Ambu aScope 5 Therapeutic | 2.8 | 5.6 | 6.0 | |
| Boston Scientific EXALT Model B Slim | 1.0 | 3.8 | 5.0 | Clamshell design working channel |
| Boston Scientific EXALT Model B Regular | 2.0 | 5.0 | 6.0 | |
| Boston Scientific EXALT Model B Large | 2.6 | 5.8 | 7.0 | |
| Verathon BFlex 2 Slim | 1.2 | 3.8 | 5 | GlideScope ET tube retainer |
| Verathon BFlex 2 Regular | 2.2 | 5.0 | 6 | |
| Verathon BFlex 2 Large | 3.0 | 5.8 | 7 | |

| Reusable Olympus Bronchoscopes | Working Channel Diameter (mm) | Scope Outer Diameter (mm) | Minimum Endotracheal (ET) Tube Size* |
|---|---|---|---|
| Therapeutic Bronchoscope (BF-1TH190) | 2.8 | 6.2 | 7.5 |
| Diagnostic Bronchoscope (BF-H190) | 2.0 | 5.5 | 7.0 |
| Diagnostic Bronchoscope (BF-P190) | 2.0 | 4.2 | 5.5 |

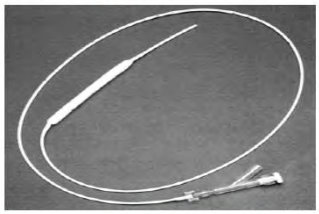
**<u>Bronchosampler for Ambu</u>**

1. Attach the flat portion of the sampler bridge to the flat portion of the Ambu scope.
2. Clamp the attachment lock into place for secure connection.
3. Attach the sample container to the port on the sampler bridge – it will click into place.
4. Place an introducer on the open port on top of the scope.
5. Connect IV Extension tubing to the introducer to allow for lidocaine to be administered through a 35cc syringe.
6. Attach suction tubing to the suction connector located on the sampler bridge.
7. The direction of the “Flow Switch” on the sampler bridge directs where sample is collected.
8. Press downward on the “Flip Top” of the sampler container and pull away to remove the sample from the bridge.



## Catheter

Cooper Surgical

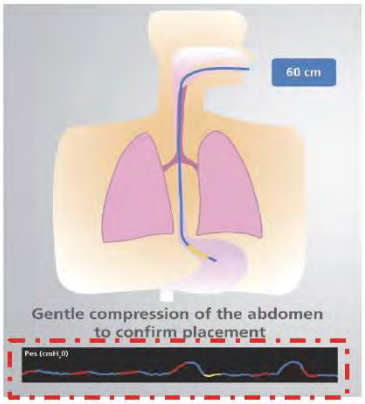


5 FR Esophageal Catheter www.coopersurgical.com

- ✓5 FR catheter
- ✓Closed End
- ✓Removable guide wire
- ✓Extension tubing
- ✓3 way stopcock

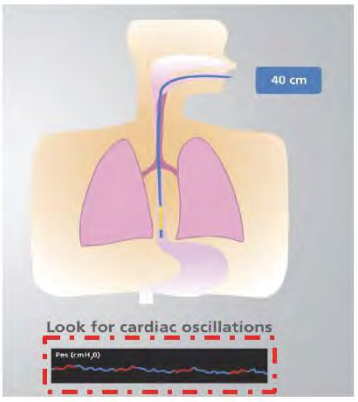
## Insertion

- Oral or Nasal Route (preference)
- Advance gently 1-2 cm at a time (avoids coiling)
- Don't advance during coughing, gagging, esophageal spasm.
- Apply Jaw thrust or head tilt if needed
- Insert to 55-60 cm in gastric space
- Insert air into balloon
  - Cooper- 1 ml
  - Smartcath-
- Perform stomach push



## Withdrawal

- Withdraw catheter slowly until cardiac oscillations appear (25-40 cm at the incisor)



**Indications**

- ✓Persistent Hypoxemia
- ✓Prone to Atelectasis
- ✓Intraabdominal Hypertension
- ✓Early onset ARDS
- ✓Morbid Obesity-Low chest wall compliance

**Contraindications**

- ✓Contraindication to NG/OG tube
- ✓Esophageal Varices, trauma, tumor
- ✓Nasal/facial Fractures
- ✓TE Fistula
- ✓Severe Coagulopathy

## Scalar Waveforms

Pressure/Time

Pes (Paux)

Ptranspulmonary

Ptrans I= 9.6
Ptrans E= -2.6

## PEEP 15

Ptrans I= 12
Ptrans E= +.03

Ptrans I goal= ≤10 Ptrans E goal= ≥ 0

## Tidal Volume Adjustment

- Tidal Volume decreased to lower Ptrans I (Inspiratory Transpulmonary Pressure) to ≤ 10 cm H2O.
- Ptrans E remained ≥ 0 cm H2O
- Goals for optimal Lung Protective Ventilation were optimized

California Thoracic Society
ATS Chapter

**CTS 2024 Annual Education Conference**
Hands-On Session: Ventilators and Ventilator Waveforms
March 8, 2024

# Hamilton C6 Ventilator

Features:

- Turbine driven – can transport patients on it, no air inlet necessary
- IntelliCuff – automated cuff manometer
    - Set desired cuff pressure & measure continuously
    - Cuff leak detection and compensation
- P/V tool – Protective Ventilation Tool
    - Generates a quasi-static P-V curve
    - Lung recruitability assessed by the differential volume between inspiration and expiration
    - Optional buy-in tool
- Esophageal manometry
    - Allows determination of transpulmonary pressure and appropriate PEEP titration
- ASV mode – Adaptive Support Ventilation, closed-loop ventilation
    - Adjusts rate & tidal volume based on Otis' least work of breathing equation
    - Minimizes chance of autoPEEP, volutrauma, and barotrauma
    - Decreases work of breathing
- Intellisync+
    - Real-time measurements of patient effort and adjusts flow trigger and inspiratory/expiratory cycling to optimize patient comfort
    - Used for spontaneous or non-invasive modes
- Support $HFO_2$ up to 60 L/m

California Thoracic Society
ATS Chapter

# Draeger V800 Ventilator

Features:

- Tablet-like touch screen
- Supports HFNC up to 80 L/min
- Automatic weaning through SmartCare/PS
    - Automatically adjusts pressure support during spontaneous breathing
- Low Flow P-V loop maneuver
    - Determination of lung recruitability from inflation and deflation curves
    - Lower inflection point utilized for optimal PEEP
- Smart Pulmonary View
    - Graphic view of compliance and resistance
    - Displays ratio between spontaneous and mandatory ventilation
- PressureLink
    - Coupling of Pinsp and PEEP
    - Setting one parameter will adjust the other automatically
- Spontaeneous-Proportional Pressure Support
    - Level of pressure support self-titrates based on patient inspiratory effort through Flow Assist and Volume Assist parameters

# Small Airways Disease and Oscillometry

**Catherine Sassoon, MD**
**Professor in Residence**
**UC Irvine/VA Long Beach**

Dr. Sassoon is Emeritus Professor of Medicine at UC Irvine with specialty in Pulmonary, Critical Care and Sleep Medicine. She did her postgraduate work at Cook County Hospital, Chicago, and UCLA School of Medicine. She had previously served as Chief of Pulmonary and Critical Care Medicine at the VA Long Beach Healthcare System, and as member of the Editorial Board of the American Journal of Respiratory and Critical Care Medicine, CHEST, and Respiratory Care. Her research interest is in mechanical ventilation, lung physiology, and diaphragmatic structure and function.

# OUTLINE

- What is Oscillometry?
- Physiology of Oscillometry
- Measured Variables and Interpretation
- Case presentation
- Clinical Application
- Limitation
- Summary

# WHAT IS OSCILLOMETRY?

- Oscillometry is a **noninvasive method** to assess respiratory mechanics, by superimposing external small oscillatory pressure generated by a loudspeaker to the airway opening of **spontaneously breathing** subject.

- The delivered pressure waveform is a sine wave of a single frequency (e.g, 5 Hz), a combination of sine waves of multiple frequencies (5 Hz, 10/11 Hz, 19/20 Hz), pseudo-random noise, or a train of pulses (5 pulses/s).

- Two commercially available oscillometry instruments based on superimposed pressure delivery:
  - Forced oscillation technique (FOT, sine waveform)
  - Impulse oscillometry (IOS, train of pulses)

*Kostorz-Nosal S et al. Respir Physiol Neurobiol 2023; 316:104135*

California Thoracic Society

# BRIEF HISTORY OF OSCILLOMETRY

- Oscillometry was first introduced by A. Dubois and coworkers: Oscillatory mechanics of the lung and chest in man. J. Appl. Physiol. 1956; 8:587-594.
- Oscillometry has evolved from bulky equipment, manual calculation, paper tracings to plain mouth-piece and a small equipment of the size of a medium shipping box

# MEASURED VARIABLES AND INTERPRETATION

# PHYSICAL PROPERTIES OF THE RESPIRATORY SYSTEM

**IMPEDANCE (Zrs)**

**The ratio of effective Pressure to effective Flow ($\frac{P}{\dot{V}}$)**

**1. RESISTANCE (Rrs)** (Real Component)

- Ratio of Pressure to Flow
- Pressure and Flow are in-phase
- Measure resistance of airways, tissue and chest wall

**2. REACTANCE (Xrs)** (Imaginary component)

- Ratio of Pressure to Flow
- Pressure and Flow are out of phase

$Zrs = \frac{P}{\dot{V}}$ = Rrs + jXrs  where j = $\sqrt{-1}$

*Zrs ~ Rrs '+' Ers '+' Irs (Equation of motion)*

**2.a. ELASTANCE (Ers)**
**(*Capacitance*)**

- Elastic properties of peripheral airways, lung parenchyma, and chest wall
- Negative component
- Dominates at low frequency

**2.b. INERTANCE (Irs)**

- Inertive force moving air column
- Positive component
- Dominates at high frequency

*Courtesy of C Cooper, MD, with permission; adapted from presentation at Spiromics 2022*
*Adapted from Kaminsky DA et al. Eur Respir Rev 2022; 31:210208*

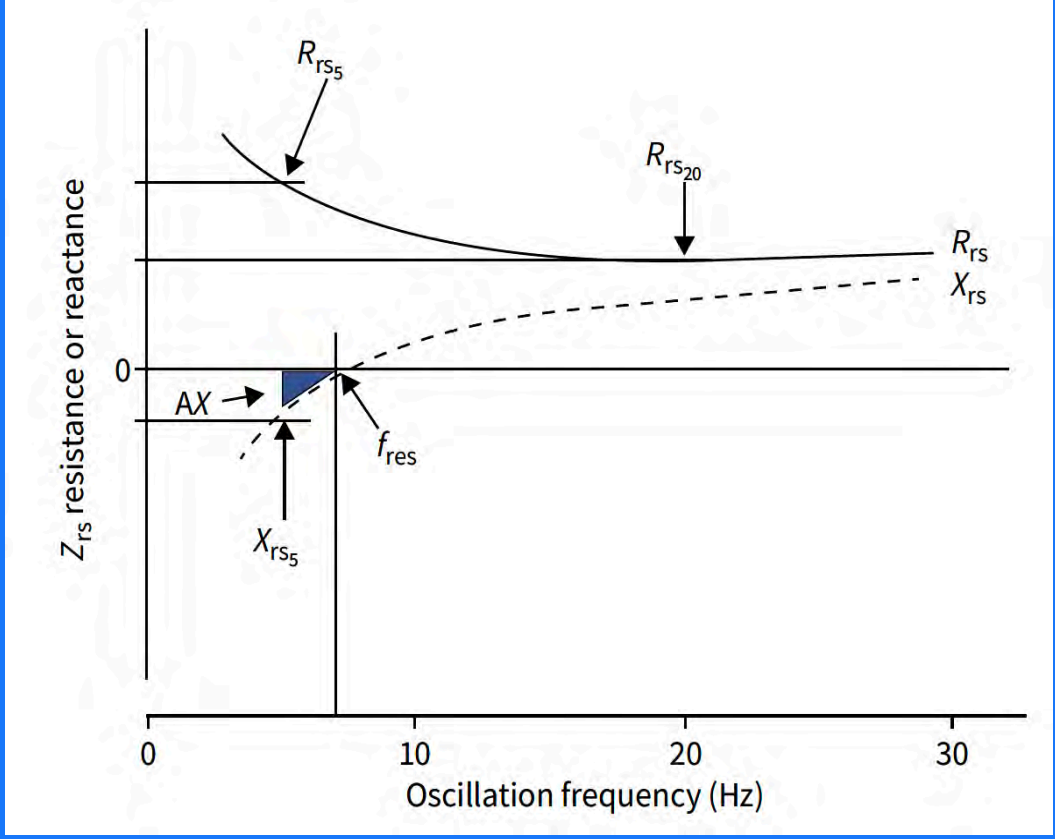
# OSCILLOMETRIC VARIABLES IN MEDIUM FREQUENCY RANGE (5-40 HZ) USED IN CLINICAL PRACTICE

## OSCILLOGRAM



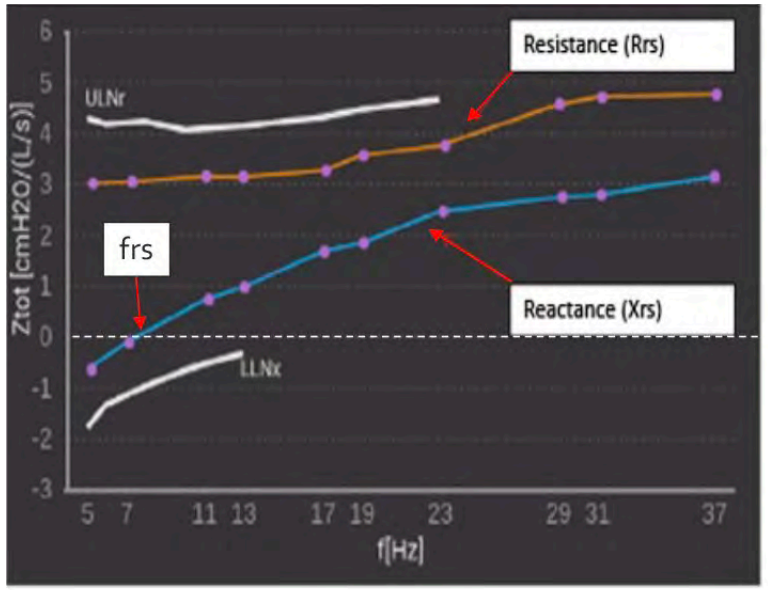
- Zrs = Impedance of the respiratory system
- Rrs = Resistance of the respiratory system
- Frequency dependence of resistance (R5-R19/20Hz)
- Xrs = Reactance of the respiratory system

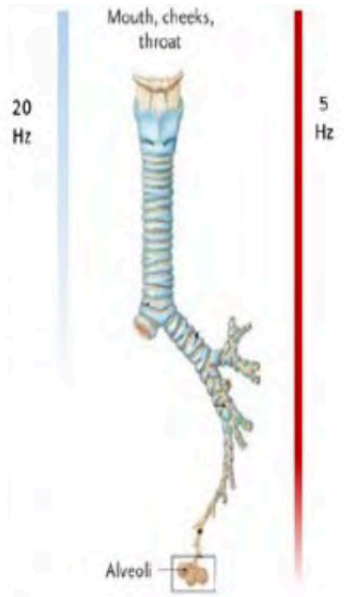
  (subscript numbers denote frequency in Hz)
- fres = Resonant frequency is the frequency where respiratory system elastance (Ers) and Inertance (Irs) make equal and opposite contributions to impedance (frs of healthy subjects is ~8-12 Hz; increases in lung disease
- AX = Area under the reactance curve subtended by the Xrs curve at the lowest frequency (5Hz) and fres

*Adapted from Kaminsky DA et al. Eur Respir Rev 2022; 31:210208*

California Thoracic Society

# RESISTANCE OF THE RESPIRATORY SYSTEM





Low frequencies travel all the way to the small airways, thus, reflect the resistive properties of the entire airway tree, while high frequencies travel only proximally, reflecting mainly central airways.

*Rentzhog CH et al. Clin Exp Allergy 2017; 47:1546*

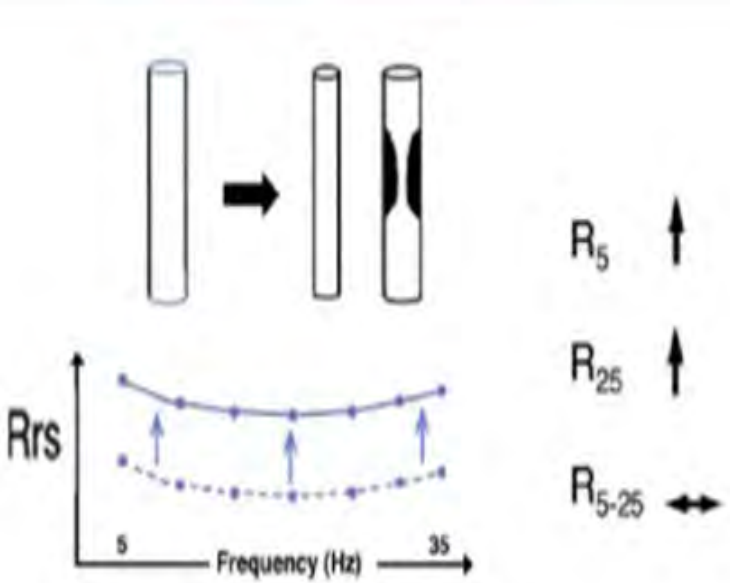
- Respiratory system resistance (Rrs)reflects frictional losses of gas flow along the airways, and in tissues of the lung and chest wall as they are stretched and deformed.
- Rrs **5 Hz** reflects **total** airway resistance, increases in **both peripheral and central airway obstruction**.
- **Rrs 19/20 Hz** reflects changes in airway caliber (bronchoconstriction, mucus plug, airway inflammation) – **central airways**.
- **Rrs 5-19/20 Hz** considered to reflect small airway disease; but is not recommended given the lack of specificity. Impairment in **Xrs 5Hz** is more sensitive to peripheral airway disease.

*Kaminsky DA et al. Eur Respir Rev 2022; 31:210208*

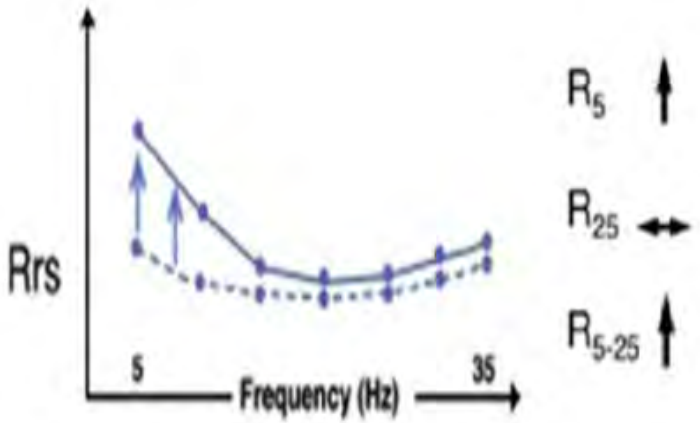
California Thoracic Society

# INTERPRETATION OF RESISTANCE

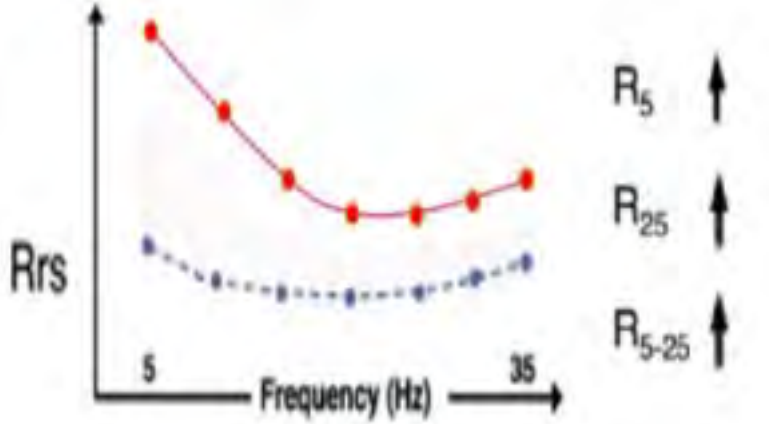
Increased Central Airway Resistance



Increased Peripheral Airway Resistance



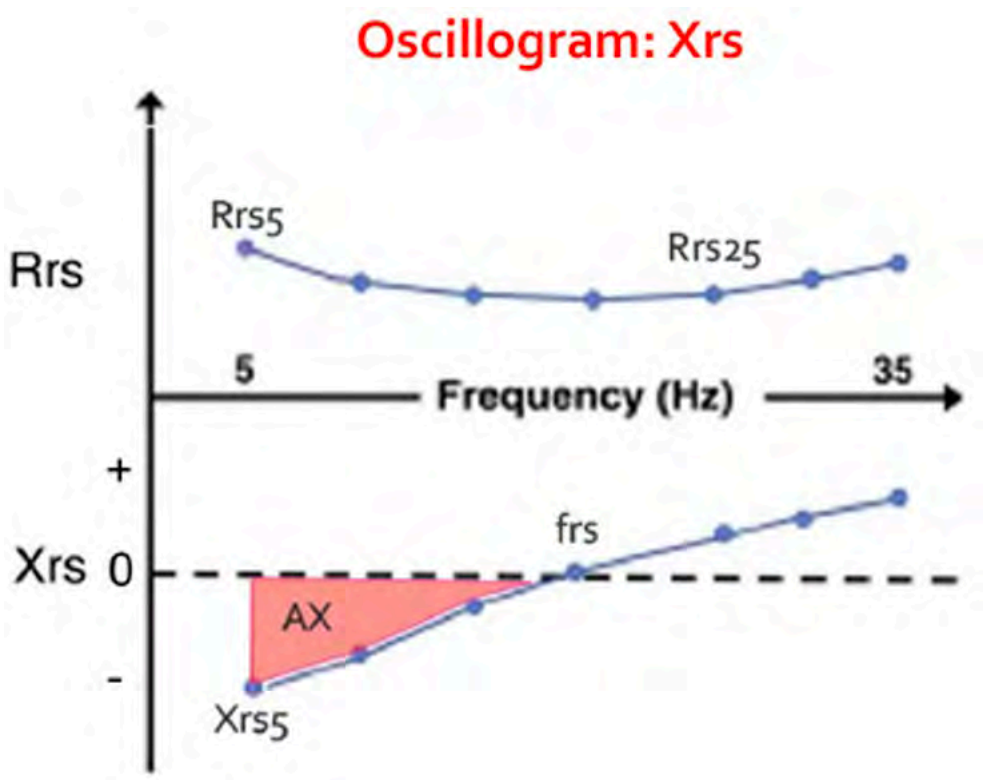
Increased Central and Peripheral Airway Resistance



*Courtesy of C. Irvin, Ph.D. with permission; adapted from Oscillometry 101, ERS Channel 2022*

California Thoracic Society

# REACTANCE OF THE RESPIRATORY SYSTEM

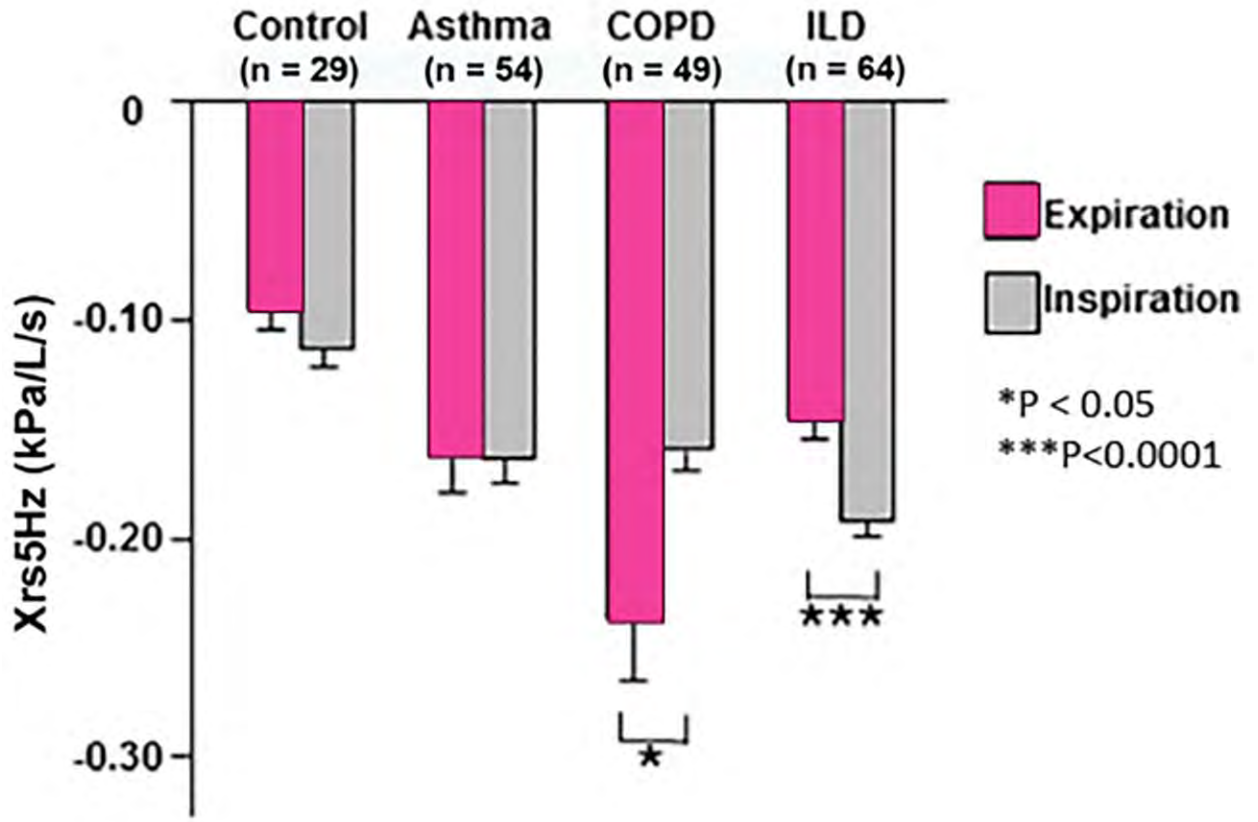


- Reactance (Xrs) expresses the energy storage, below the frs reflects respiratory system elastance (Ers) due to stifness of the lung tissue, airways and chest wall and above frs reflects respiratory system inertance (Irs) due to the mass of gas in the central airways → [ Xrs = Ers + Irs ].
- Xrs 5 Hz becomes more negative in lung disease, indicating the respiratory system becomes stiffer; reflects also small airway heterogeneity in obstructive lung disease.
- AX (cm H2O/L): The area AX reflects the stiffness of the lung parenchyma, potentially more sensitive to changes in the elastic properties of the respiratory system than Xrs at single frequency.

*Kaminsky DA et al. Eur Respir Rev 2022; 31:210208*
*Kostorz-Nosal S et al. Respir Physiol Neurobiol 2023; 316:104135*

California Thoracic Society

# INTRABREATH INSPIRATORY AND EXPIRATORY XRS-5HZ IN COPD AND ILD

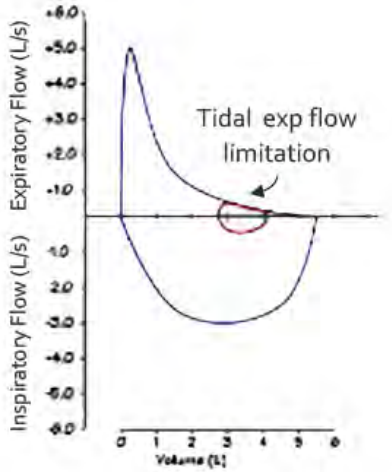


*Adapted from Sugiyama A et al: Respir Med 2013; 107:875*
*Kostorz-Nosal S et al. Respir Physiol Neurobiol 2023; 316:104135*

California Thoracic Society

# REACTANCE OF THE RESPIRATORY SYSTEM IN COPD

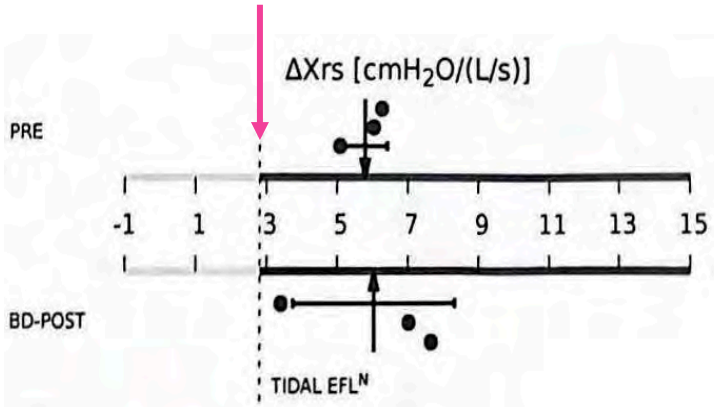
- Changes in intra-breath Xrs at 5Hz between inspiration and expiration are useful to detect **expiratory flow-limitation**.



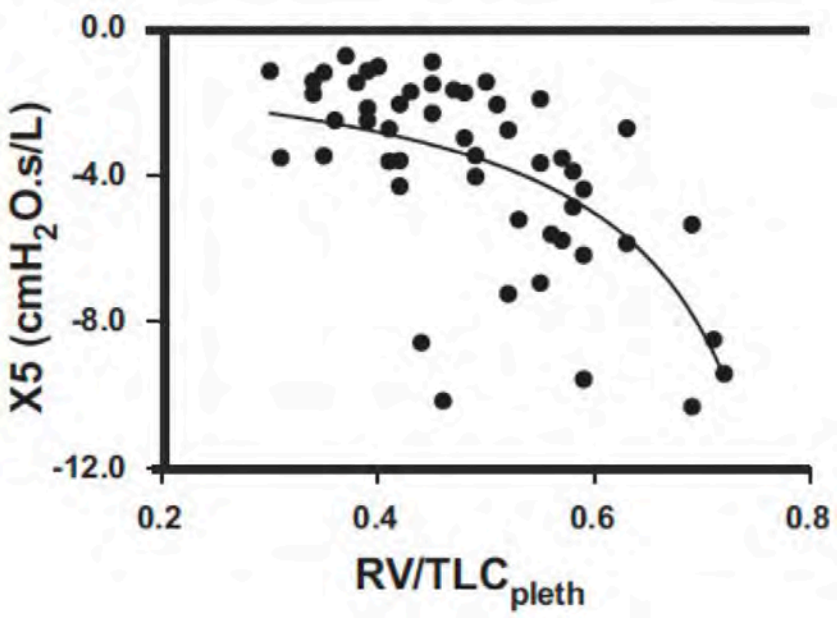
$\Delta Xrs_{5Hz} = Xrs_{5Hz}$ insp - $Xrs_{5Hz}$ exp

Threshold tidal EFL:

$\Delta Xrs_{5Hz} \geq 2.8$ cm H2O/L/s



- Xrs 5Hz is sensitive to airway closure, reflecting communicating lung volume (i.e., air trapping).



*Dellaca RL et al. Eur Respir J 2004;23:232*

California Thoracic Society

# BRONCHODILATOR RESPONSE CRITERIA

## Significant Bronchodilator Response Threshold:

- **ADULTS and CHILDREN**

  - Rrs5Hz: 40% decrease from baseline
  - Xrs5Hz: 50% increase
  - AX: 80% decrease

# CASE # 1 INTERPRETATION

- $Rrs_{5Hz}$ is within normal limits with no significant response to bronchodilator.
- $Xrsexp_{5Hz}$ increased (more negative), suggests impaired mechanical properties of the peripheral airways due to peripheral airways inflammation, and/or ventilation inhomogeneities.
- Following bronchodilator administration, $Xrsexp_{5Hz}$ decreased >50% (less negative), with frs shifted to lower frequency, suggests a significant response to bronchodilator.
- Poor control asthma symptoms together with abnormal reactance ($Xrsexp_{5Hz}$) and response to bronchodilator are consistent with asthma.

# RELATIONSHIP OF ABNORMAL SPIROMETRY AND ABNORMAL OSCILLOMETRY TO POOR ASTHMA CONTROL

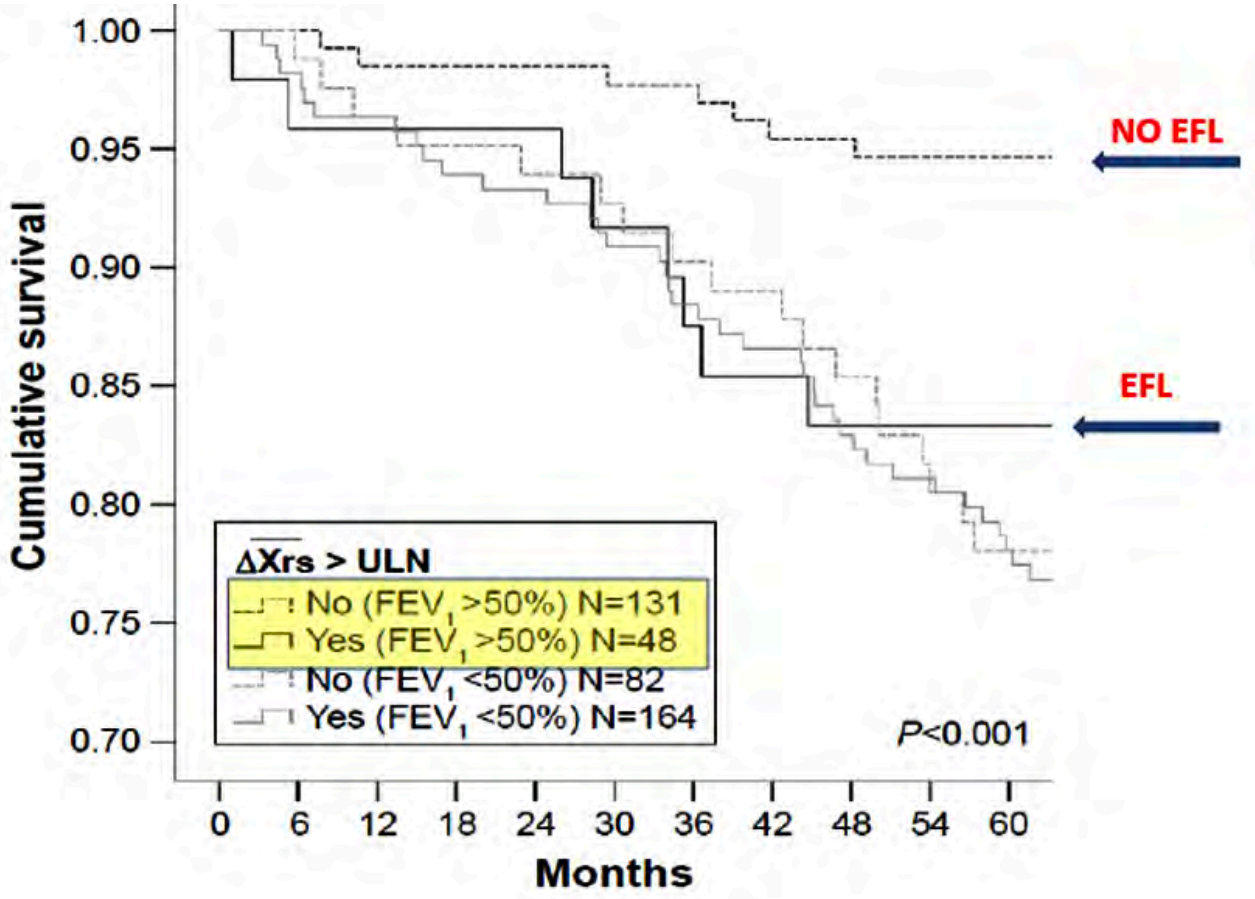
*EFL Threshold ≥ 2.8 cmH2O/L/s

California Thoracic Society

# CASE #2 INTERPRETATION

- $Rrs_{5Hz}$ is within normal limits with no significant response to bronchodilator.
- $Xrsexp_{5Hz}$ and $Xrstot_{5Hz}$ increased (more negative) suggests impaired mechanical properties of peripheral airways, ventilation inhomogeneity, airway closure, and increased chest wall stiffness (obesity).
- The presence of EFL leads to air trapping (increased RV/TLC).
- Following bronchodilator administration, both $Xrsexp_{5Hz}$ and $Xrstot_{5Hz}$ decreased >50% (less negative), with frs shifted to lower frequency, suggests a significant response to bronchodilator.
- The above findings are consistent with Chronic Bronchitis or Asthma

# INTRA-BREATH EFL DISCRIMINATE SURVIVAL IN MODERATELY SEVERE COPD (ECLIPSE TRIAL)



- In moderately severe COPD (FEV1 > 50% pred), oscillometry detected ~27 % of patients with EFL.
- In this group of patients, EFL predicts high risk for mortality
- In severe or very severe COPD (FEV1 <50% pred), FEV1 predicts high risk of mortality irrespective of EFL.
- Detection of EFL leads to early intervention, e.g., pulmonary rehabilitation may be of benefit.

California Thoracic Society

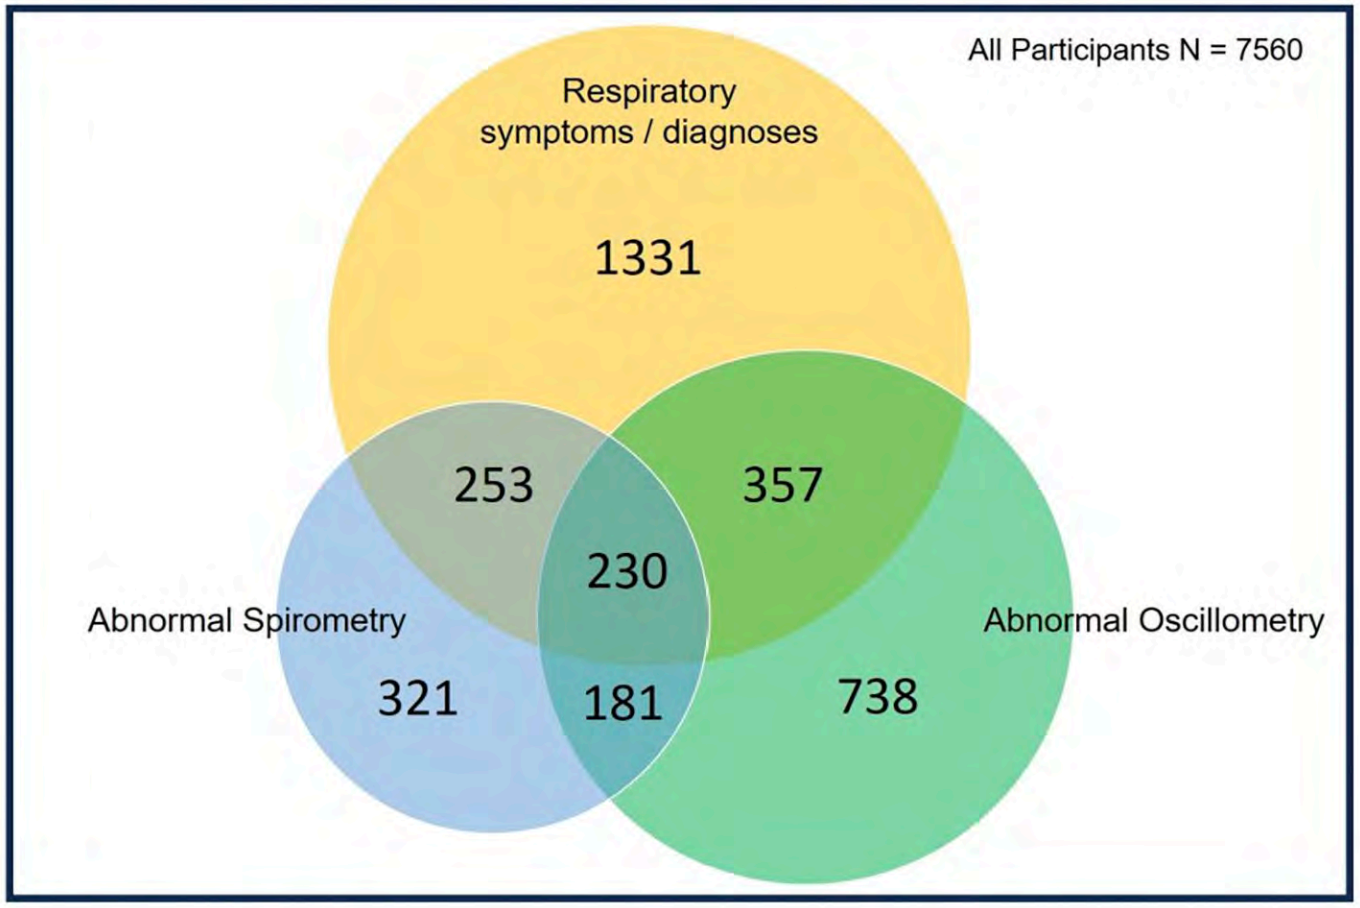
# DIAGNOSTIC POTENTIAL OF OSCILLOMETRY
## LEAD [LUNG HEART SOCIAL BODY] STUDY



- General population 18-90 yrs (total n: 7560; with symptoms /disease n = 2171)
- Abnormal Oscillometry detected in 20% (1506/7560) of population
- Abnormal Spirometry detected in 13% (985/7560) of population
- Abnormal oscillometry alone identified 27% (587/2171) of subjects with respiratory symptoms/disease
- Abnormal spirometry alone identified 22.2% (483/2171) of subjects with respiratory symptoms/disease
- Combined abnormal oscillometry and spirometry identified 38.8% (840/2171) of subjects with respiratory symptoms/disease

*Veneron C et al. Am J Repir Crit Care Med 2024; 209: 444*

California Thoracic Society

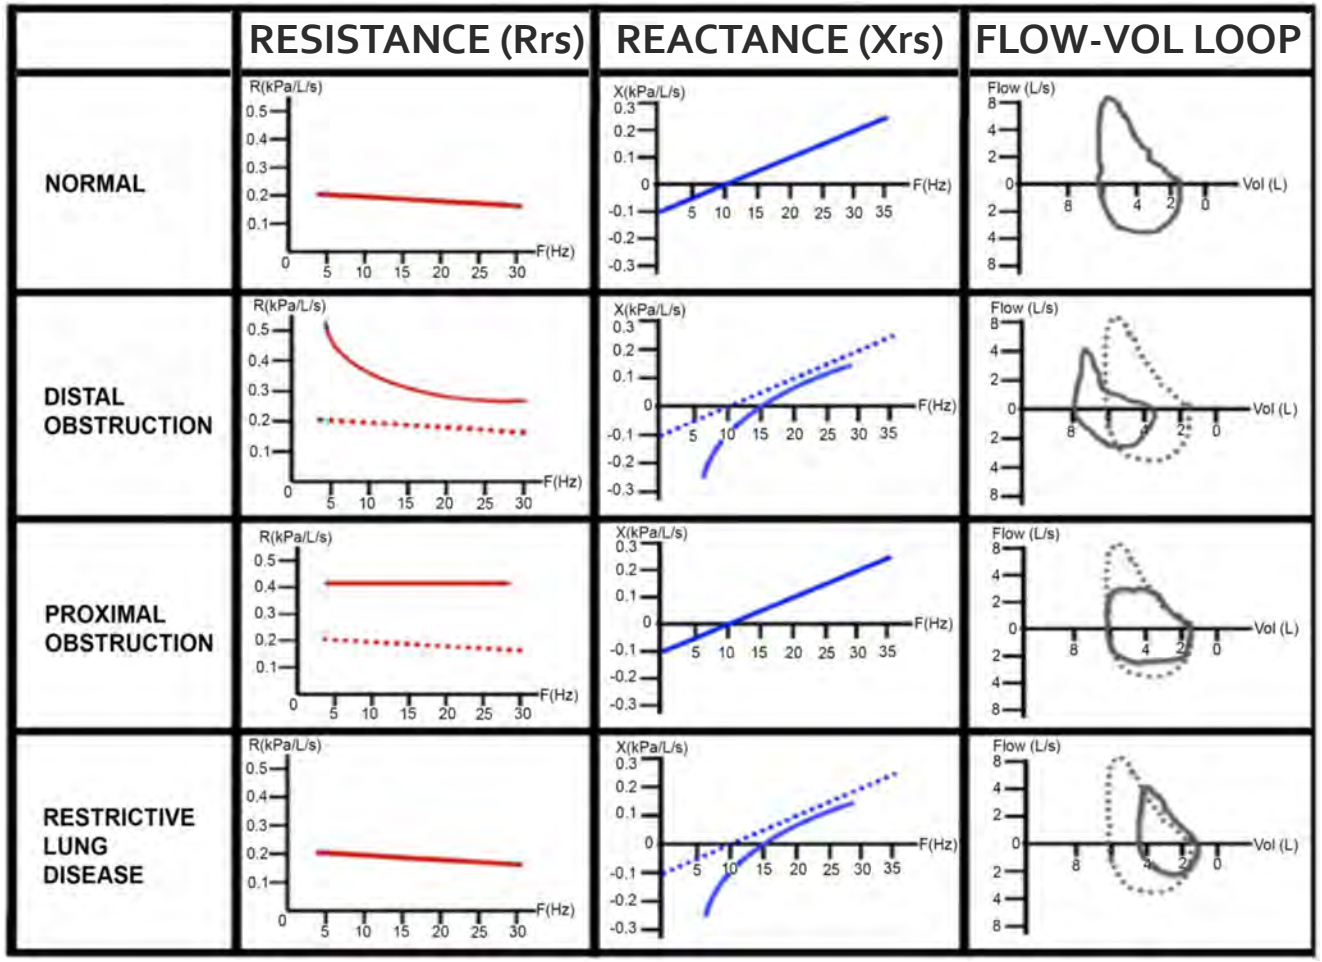
# LIMITATIONS OF OSCILLOMETRY

- No extensive reference normal values comparable to Global Lung Function Initiative (GLI) reference values for spirometry, lung volumes and DLCO [e.g., Rrs5-19Hz].
- Unable to determine the degree of severity similar to the degree of obstruction with GOLD's percent predicted FEV1.
- Resistance and Reactance are volume dependent, yet, unable to correct for lung volume. Since bronchodilation reduces lung hyperinflation, this would potentially cause paradoxical increase in Rrs and decrease Xrs, therefore, the interpretation of bronchodilator responses of Rrs and Xrs may not be straightforward and could cause some disparity with spirometry response.

# SUMMARY

California Thoracic Society

# SUMMARY OF OSCILLOMETRIC RESISTANCE AND REACTANCE PATTERN IN NORMAL AND DISEASE



*Adapted from Komarow HD et al. Ann Allergy Asthma Immunol 2011; 106: 191*

California Thoracic Society

# TAKE HOME MESSAGE

- Oscillometry complements existing conventional pulmonary function tests.
- Oscillometry is useful for longitudinal monitoring of lung function from the very young to the very old, essentially throughout life.
- Increased Rrs5Hz is consistent with peripheral airway obstruction.
- Increased Rrs at all frequencies is consistent with central airway obstruction
- Reactance at 5 Hz is sensitive to detect impaired mechanical properties of the peripheral airways, however, it increases (more negative) in both obstructive disease (due to parenchymal inhomogeneity, peripheral airway wall stiffness, or air trapping from dynamic airway closure) and restrictive disease (due to increased stiffness of lung parenchyma or chest wall), hence clinical correlation is necessary.

# Biologics for COPD

**Stephanie Christenson, MD, MAS**
**Associate Professor**
**UC San Francisco**

Dr. Christenson is an Associate Professor at the University of California, San Francisco in the Division of Pulmonary, Critical Care, Allergy, and Sleep Medicine. She serves as an attending physician on the Pulmonary Consult Service and in the Pulmonary Clinic. Dr. Christenson obtained her undergraduate degree at the University of Wisconsin, Madison and her medical degree at the Medical College of Wisconsin. She completed her residency training as well as a year of research training in computational biology at Boston Medical Center. She then came to UCSF for fellowship in Pulmonary and Critical Care Medicine where she also obtained a Master's in Clinical Research, after which she joined faculty.

Dr. Christenson's research program integrates her expertise in genomics/bioinformatics and clinical research to study chronic airway disease and the associated risk factors. Her research emphasizes innovative computational tools, systems biology approaches, and 'omics biomarkers to better inform our understanding of the biology underlying clinical traits and outcomes in asthma, smoking, and COPD. Dr. Christenson also serves in multiple leadership roles for multi-center studies and advises industry on trials of biologic and inhaled therapies for COPD. Leadership roles include co-director of the Genetics and Genomics Subcommittee for the multi-center SPIROMICS and SOURCE studies, the UCSF site PI for the American Lung Association (ALA) Airway Clinical Research Consortium, and a Disease Study Site PI for the NHGRI-funded Multi-Omics in Health and Disease (MOHD) Consortium.

# Eosinophils as a therapeutic target: Anti-IL-5 Biologics

## *Mixed Results to Date*

### Mepolizumab (anti-IL-5)

**Eligibility**
- 10 pack year smoking history
- Triple therapy x3 months
- ≥ 2 moderate or ≥ 1 severe exacerbation
- Current diagnosis of asthma excluded
- Blood Eos:
  ≥150/µL at screening **OR**
  ≥300/µL during previous year

**METREX**
- *Statistically significant 18% reduction in exacerbations*
- No difference in symptom scores

**METREO**
- Did not reach significance for exacerbations
- No difference in symptom scores

### Benralizumab (anti-IL-5Rα)

**Eligibility**
- 10 pack year smoking history
- Dual or Triple Therapy
- ≥ 2 moderate or ≥ 1 severe exacerbation
- Symptomatic: MMRC ≥ 1
- Current diagnosis of asthma excluded
- Blood Eos:
  ≥220/µL at baseline

**GALATHEA** **Terranova**
- Neither reached significance for exacerbations
- *Both showed improvement in lung function*

*Lipson D, NEJM 2018* *Pavord ID, NEJM 2017*

## Additional Outcomes

**Table 2. End Points Corrected for Multiplicity (Intention-to-Treat Population).***

| End Point | Placebo (N=471) | Dupilumab (N=468) | P Value |
|---|---|---|---|
| **Primary end point** | | | |
| Annualized rate of moderate or severe exacerbations of COPD | | | |
| Adjusted annualized rate of moderate or severe exacerbations — events per yr (95% CI) | 1.10 (0.93 to 1.30) | 0.78 (0.64 to 0.93) | |
| Rate ratio vs. placebo (95% CI) | — | 0.70 (0.58 to 0.86) | <0.001 |
| **Secondary and other end points** | | | |
| Change in prebronchodilator $FEV_1$ from baseline to wk 12 | | | |
| Least-squares mean change (95% CI) — liters | 0.077 (0.042 to 0.112) | 0.160 (0.126 to 0.195) | |
| Least-squares mean difference vs. placebo (95% CI) — liters | — | 0.083 (0.042 to 0.125) | <0.001 |
| Change in prebronchodilator $FEV_1$ from baseline to wk 52 | | | |
| Least-squares mean change (95% CI) — liters | 0.070 (0.033 to 0.107) | 0.153 (0.116 to 0.189) | |
| Least-squares mean difference vs. placebo (95% CI) — liters | — | 0.083 (0.038 to 0.128) | <0.001 |
| Change in prebronchodilator $FEV_1$ from baseline to wk 12 among patients with a baseline $F_ENO$ ≥20 ppb | | | |
| Least-squares mean change (95% CI) — liters | 0.108 (0.038 to 0.177) | 0.232 (0.164 to 0.299) | |
| Least-squares mean difference vs. placebo (95% CI) — liters | — | 0.124 (0.045 to 0.203) | 0.002 |
| Change in prebronchodilator $FEV_1$ from baseline to wk 52 among patients with a baseline $F_ENO$ ≥20 ppb | | | |
| Least-squares mean change (95% CI) — liters | 0.120 (0.047 to 0.192) | 0.247 (0.176 to 0.318) | |
| Least-squares mean difference vs. placebo (95% CI) — liters | — | 0.127 (0.042 to 0.212) | 0.003 |
| Change in SGRQ total score from baseline to wk 52 | | | |
| Least-squares mean change (95% CI) | −6.4 (−8.0 to −4.8) | −9.7 (−11.3 to −8.1) | |
| Least-squares mean difference vs. placebo (95% CI) | — | −3.4 (−5.5 to −1.3) | 0.002 |
| SGRQ total score improvement ≥4 points at wk 52 | | | |
| Percentage of patients (95% CI) | 43.1 (38.6 to 47.7) | 51.5 (46.9 to 56.1) | |
| Odds ratio vs. placebo (95% CI) | — | 1.4 (1.1 to 1.9) | 0.009 |
| Change in E-RS–COPD total score from baseline to wk 52 | | | |
| Least-squares mean (95% CI) | −1.6 (−2.1 to −1.1) | −2.7 (−3.2 to −2.2) | |
| Least-squares mean difference vs. placebo (95% CI) | — | −1.1 (−1.8 to −0.4) | 0.001 |
| Annualized rate of moderate or severe exacerbations of COPD among patients with a baseline $F_ENO$ ≥20 ppb | | | |
| Adjusted annualized rate of moderate or severe exacerbations — events per yr (95% CI) | 1.12 (0.83 to 1.50) | 0.70 (0.51 to 0.96) | |
| Rate ratio vs. placebo (95% CI) | — | 0.62 (0.45 to 0.87) | 0.005 |

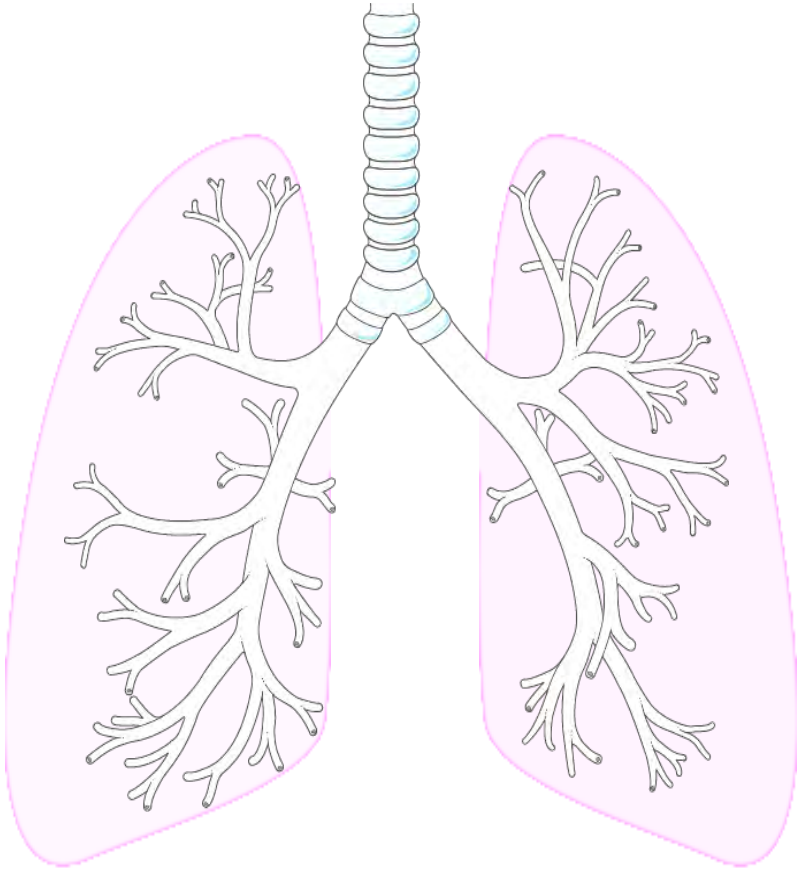
# Conclusions

- There is evidence that T2 inflammation plays a major role in a subset of patients with COPD
- Patients with T2 inflammation, as measured by blood eos, appear to respond better to inhaled corticosteroids than those without T2 inflammation
- There are multiple T2 biologics in the pipeline for COPD with clinical trials ending in 2024 and 2025
- Dupilumab is currently the only biologics with strongly positive results in COPD, but there is promise that others will work in COPD subgroups with blood eosinophils >300.
- Alarmin-based therapy, targeting IL-33 or TSLP, is being studied in both T2 low and T2 high individuals.



# Bronchoscopic Management of Airways Diseases

**Brian Shaller, MD**
**Assistant Professor**
**Stanford**

Brian Shaller is a Clinical Assistant Professor in the Division of Pulmonary, Allergy & Critical Care Medicine at Stanford University. He trained in Interventional Pulmonology at the Cleveland Clinic and helped establish Stanford's Interventional Pulmonology fellowship program in 2022, for which he currently serves as Associate Program Director. Dr. Shaller's clinical and academic interests include advanced diagnostics for lung nodules, endoscopic management of central airway diseases, and procedural education.

# BRONCHOSCOPIC MANAGEMENT OF ~~AIRWAY~~ BENIGN obstructive lung DISEASES

FOR ALL PULMONOLOGISTS!

Brian Shaller, MD

Clinical Assistant Professor of Medicine

Associate Program Director, Interventional Pulmonology Fellowship

Stanford University School of Medicine

California Thoracic Society

# RELEVANT DISCLOSURES

- I have the following relationships with ACCME defined ineligible companies:
  - None pertinent to this topic

- I WILL discuss off-label use and/or investigational use of any drugs or devices
  - Bronchial rheoplasty, cryospray, and targeted lung denervation have breakthrough device designation from the FDA and are approved for use in clinical trials only

# OBJECTIVES

- Identify benign airway diseases for which there are bronchoscopic interventions
- Describe general mechanisms of action of different interventions
- Discuss clinical evidence and eligibility criteria for different interventions
- Assess the role of bronchoscopic interventions in broader context of patient care

# LIMITATIONS OF THERAPEUTIC BRONCHOSCOPY

| | Generation | | Diameter, cm | Length, cm | Number | Total cross sectional area, $cm^2$ |
|---|---|---|---|---|---|---|
| Conducting zone | Trachea | 0 | 1.80 | 12.0 | 1 | 2.54 |
| | Bronchi | 1 | 1.22 | 4.8 | 2 | 2.33 |
| | | 2 | 0.83 | 1.9 | 4 | 2.13 |
| | | 3 | 0.56 | 0.8 | 8 | 2.00 |
| | Bronchioles | 4 | 0.45 | 1.3 | 16 | 2.48 |
| | Terminal bronchioles | 5 ↓ 16 | 0.35 ↓ 0.06 | 1.07 ↓ 0.17 | 32 ↓ $6\times10^4$ | 3.11 ↓ 180.0 |
| Transitional and respiratory zones | Respiratory bronchioles | 17 | ↓ | ↓ | ↓ | ↓ |
| | | 18 | | | | |
| | | 19 | 0.05 | 0.10 | $5\times10^5$ | $10^3$ |
| | Alveolar ducts | $T_3$ 20 | ↓ | ↓ | ↓ | ↓ |
| | | $T_2$ 21 | | | | |
| | | $T_1$ 22 | | | | |
| | Alveolar sacs | T 23 | 0.04 | 0.05 | $8\times10^6$ | $10^4$ |

| Do I have a bronchoscopic intervention? |
|---|
| Definitely |
| Possibly |
| I guess I can take a look . . . |
| Wait, what?<br><br>Isn't there an inhaler for that? |

California Thoracic Society

# LIMITATIONS OF THERAPEUTIC BRONCHOSCOPY

| RANK | ICD-10 CODE | ICD-10 DESCRIPTION | PERCENT OF PULMONOLOGIST VISITS |
|---|---|---|---|
| 1 | J449 | Chronic obstructive pulmonary disease, unspecified | 8.90% |
| 2 | J069 | Acute upper respiratory infection, unspecified | 7.00% |
| 3 | J301 | Allergic rhinitis due to pollen | 5.90% |
| 4 | J9601 | Acute respiratory failure with hypoxia | 5.40% |
| 5 | J029 | Acute pharyngitis, unspecified | 5.10% |
| 6 | J45909 | Unspecified asthma, uncomplicated | 4.80% |

https://www.definitivehc.com/resources/healthcare-insights/top-conditions-pulmonologist-visits

California Thoracic Society

# EVOLUTION OF BRONCHOSCOPIC THERAPEUTICS

- **First 100+ years:** therapeutics limited to central-lobar-segmental airways

- **Last 10-15 years:** multiple new treatment options for peripheral obstructive lung diseases

  - **2010:** bronchial thermoplasty for asthma
  - **2018:** endobronchial valves for emphysema
  - **2019:** bronchial rheoplasty and cryospray for chronic bronchitis
  - **2020:** targeted lung denervation for COPD

# APPROVED INTERVENTIONS

**Bronchial thermoplasty (asthma)**

**Bronchoscopic lung volume reduction (emphysema)**

California Thoracic Society

# BRONCHIAL THERMOPLASTY (BT)

- Delivery of radiofrequency (RF) energy to intermediate-size airways for the treatment of severe asthma

- Alair system (Boston Scientific) FDA-approved since 2010

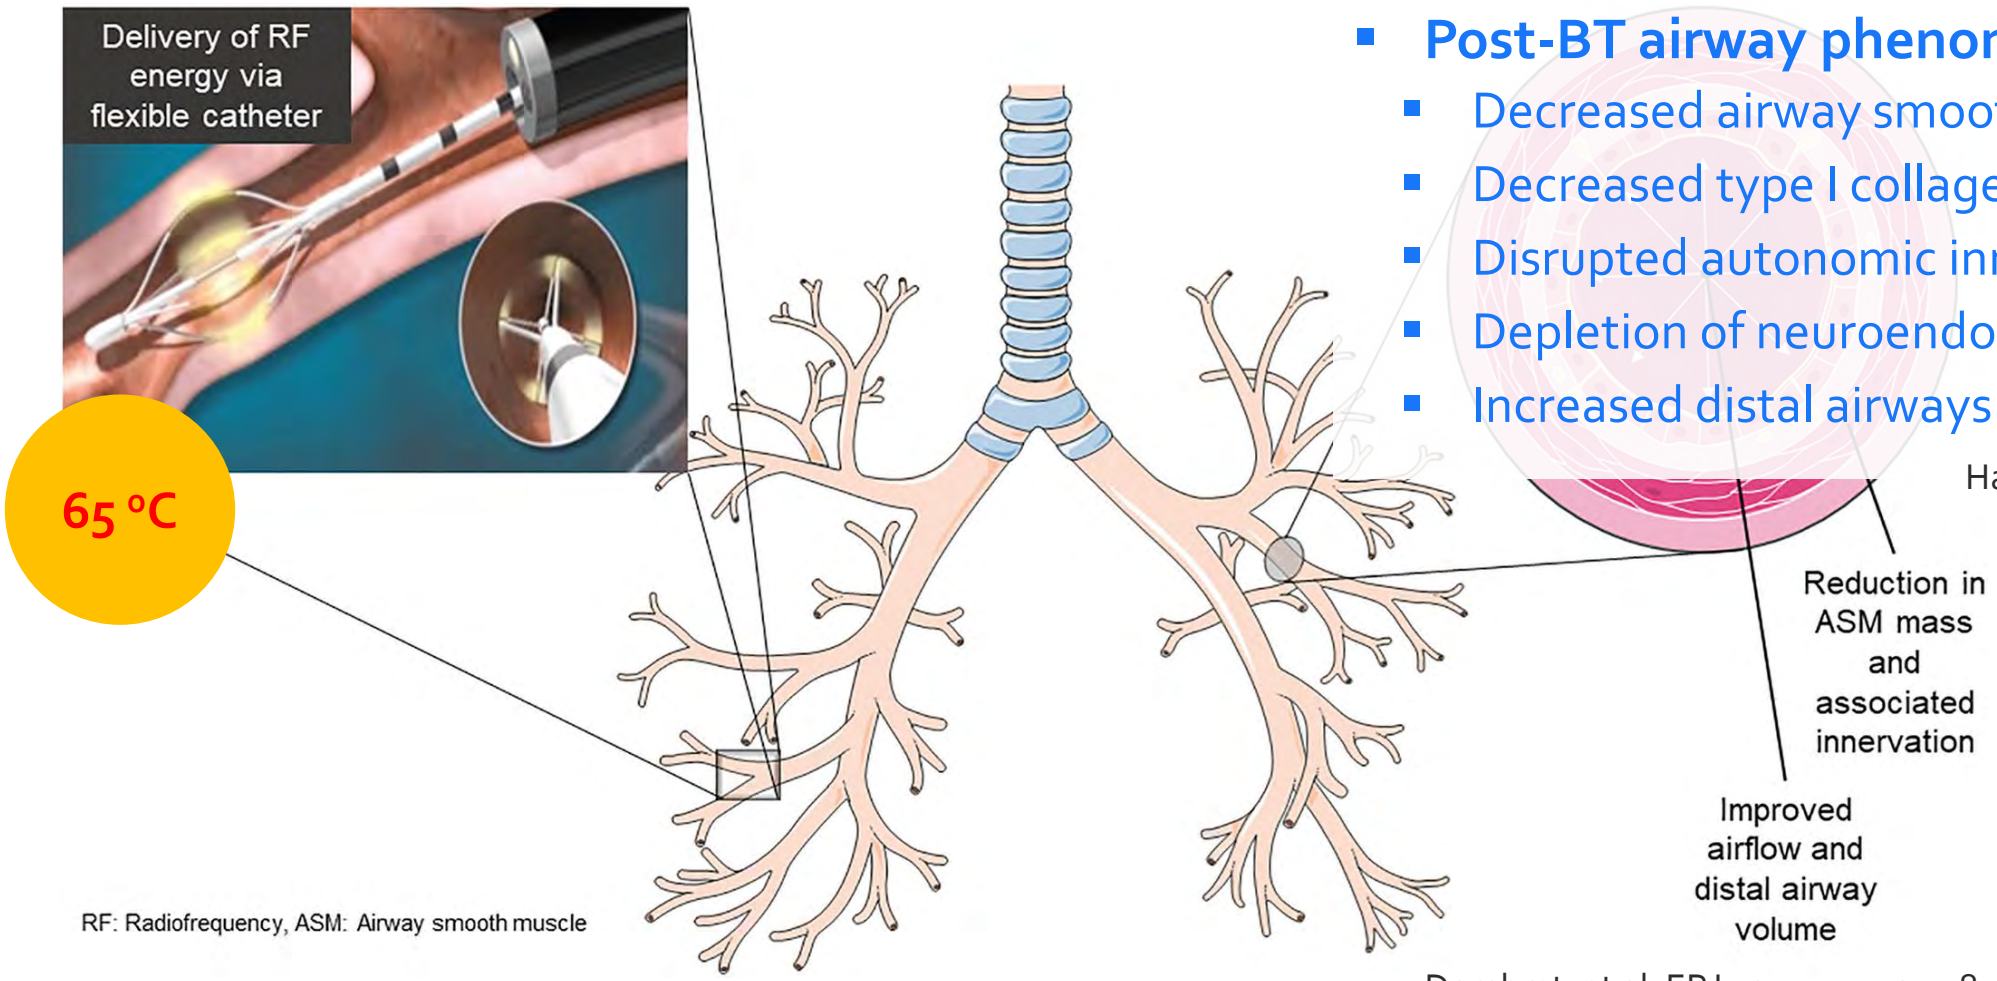
Foot pedal

Grounding pad

Catheter (1.5 mm OD)

California Thoracic Society

# BRONCHIAL THERMOPLASTY (BT)



- **Post-BT airway phenomena:**
  - Decreased airway smooth muscle mass
  - Decreased type I collagen deposition
  - Disrupted autonomic innervation
  - Depletion of neuroendocrine cells
  - Increased distal airways volume on HRCT

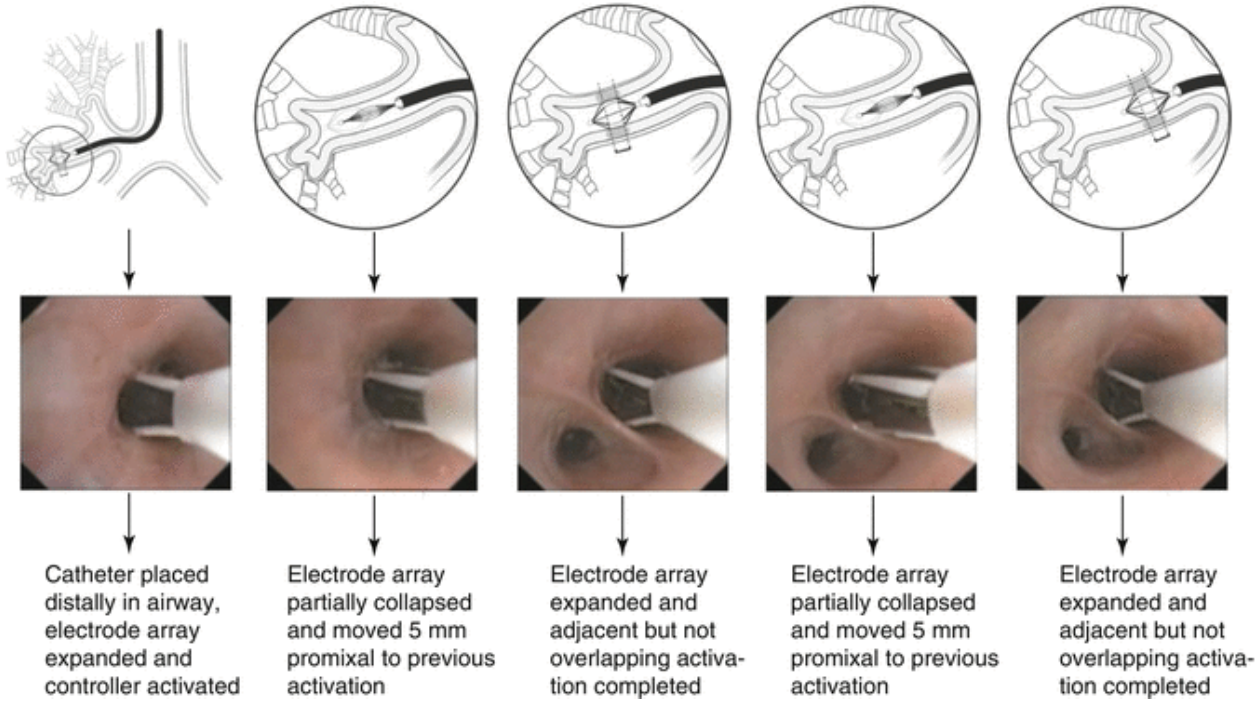
Hashmi, et al. Respirology 2022.

Dombret, et al. ERJ 2014;23:510-518.

California Thoracic Society

# BRONCHIAL THERMOPLASTY (BT)

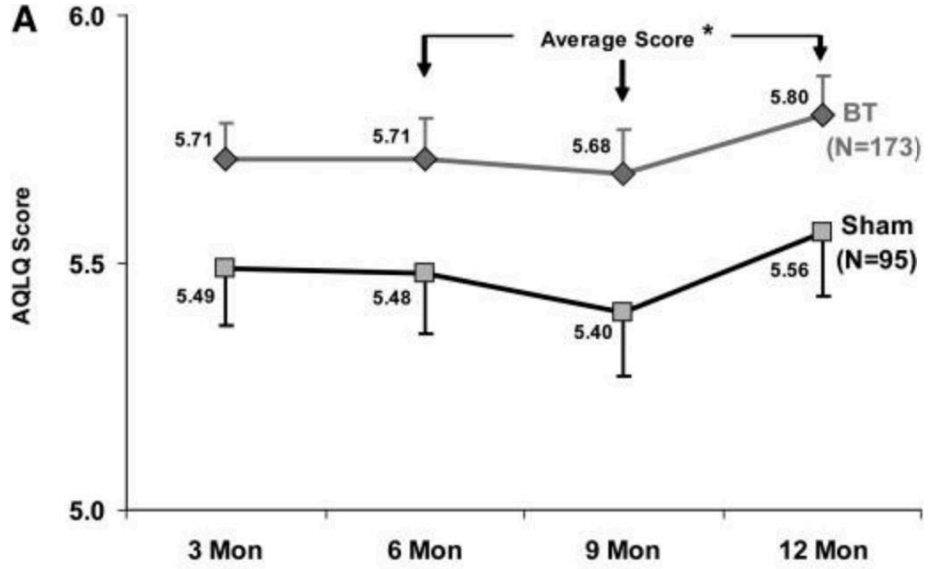
- **Course of treatment:**
  - 3 sessions (RLL, LLL, both upper lobes)
  - 3 weeks apart
  - Treat all airways from 3 → 10 mm in diameter

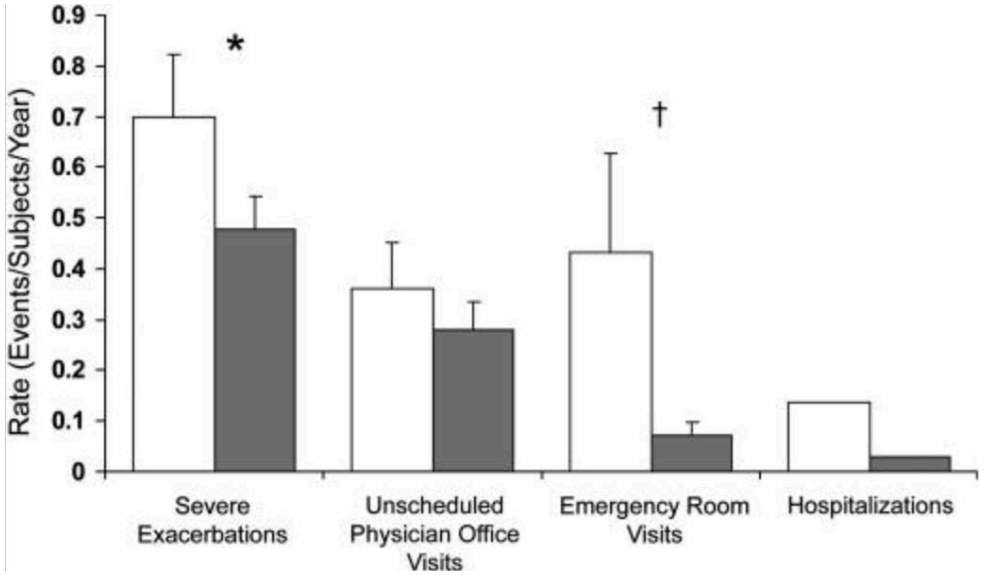


California Thoracic Society

# BRONCHIAL THERMOPLASTY (BT)

- **AIR2 (2010)** – multicenter, double-masked, sham-controlled randomized trial
  - Pre-BD $FEV_1$ ~78%p, Asthma QoL Questionnaire score ~4.4
  - Small but statistically significant improvements in AQLQ, severe exacerbations, ED visits @ 12 mo
  - Sustained improvements over median 12 yrs (BT10+, 2021)





**AIR2:** Castro, et al. AJRCCM 2010.
**BT10+:** Chaudhuri, et al. Lancet Respir Med 2021.

California Thoracic Society

# BRONCHIAL THERMOPLASTY (BT)

- **Risks/complications:**
  - Asthma exacerbation *(increased* x 3 mo post-tx), upper respiratory tract infection
  - Lower respiratory tract infection, atelectasis, hemoptysis (*uncommon*)

- **AIR2 (2010):**
  - 85% experienced an adverse event (~1 event/session)
  - 8.4% required hospitalization

Castro, et al. AJRCCM 2010.

# BRONCHIAL THERMOPLASTY (BT)

- **Eligibility criteria:**
  - ≥ 18 years old
  - Severe asthma
  - GINA step ≥ 4 treatment
  - $T_H2$-low phenotype
  - ACT score ≤ 19

- **Exclusion criteria:**
  - Smoker
  - Life-threatening exacerbations/24 mo
  - ≥ 3 LRTIs/12 mo
  - $FEV_1$ < 50%p
  - Implanted electronic device

California Thoracic Society

# BRONCHIAL THERMOPLASTY (BT)

- **Criticisms of BT:**
  - Study patient characteristics not clearly representative of severe asthma
  - Racial/ethnic homogeneity (80% white in AIR2)
  - High rate of AEs, increased exacerbations over 3 months
  - Magnitude of benefit may not be clinically meaningful
  - Degree of benefit in sham arm (placebo effect)
  - Lack of long-term follow-up for sham controls

Thomson NC. J Asthma Allergy 2019.

# BRONCHIAL THERMOPLASTY (BT)

- **Role of BT in asthma treatment:**
  - Uncontrolled at Step 5, referred to specialty center, no access/eligibility for biologics (GINA 2023)

https://ginasthma.org/2023-gina-main-report/

- **Biased opinion:**
  - Consultation with asthma specialist and consideration of clinical trials should come first
  - Failure of advanced medical management should prompt reevaluation of diagnosis
  - BT is becoming treatment of last resort

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

- Bronchoscopic procedure to treat hyperinflation in patients with emphysema

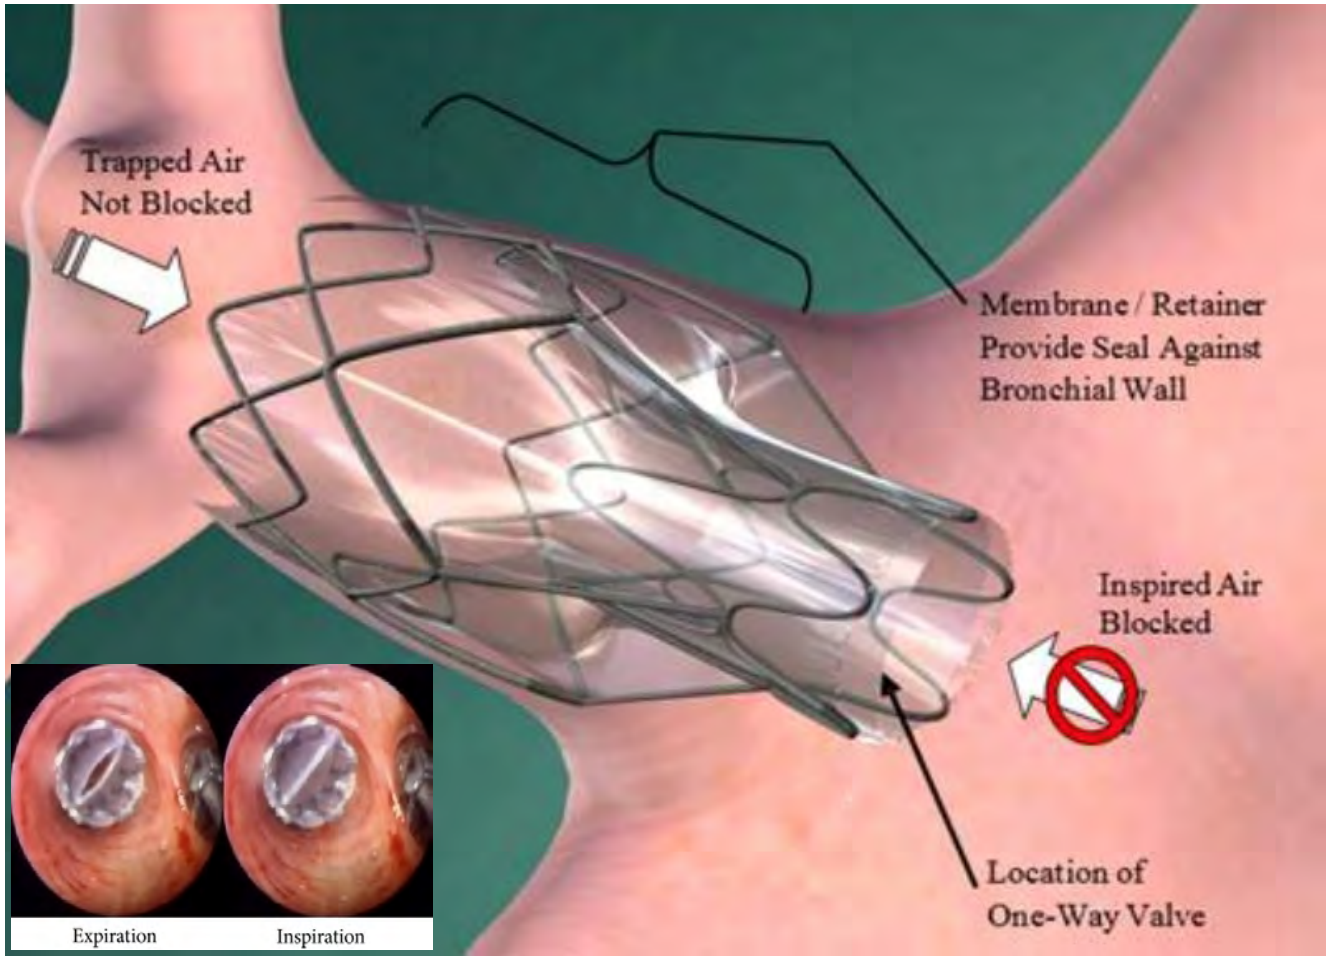
- Various modalities have been/are being studied
  - Endobronchial coils
  - Airway bypass stents
  - Thermal vapor ablation
  - One-way endobronchial valves

**Zephyr**

**Spiration**

California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)



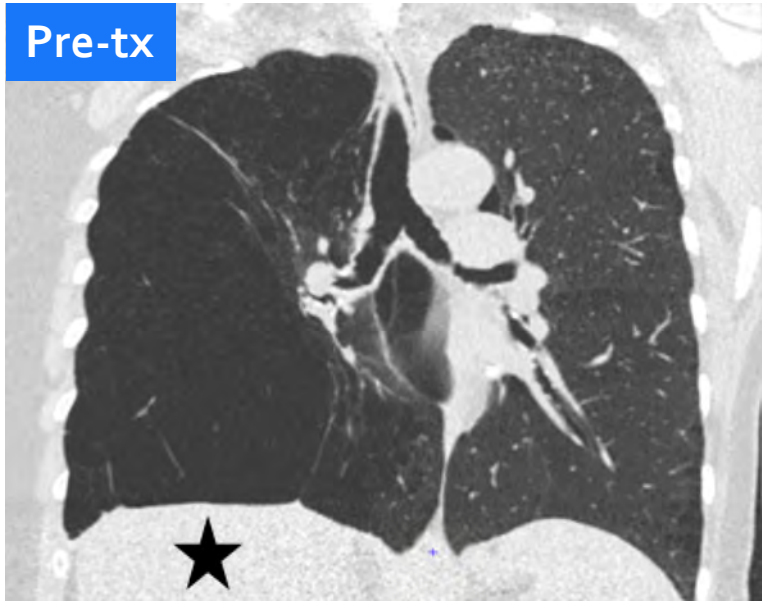
https://www.accessdata.fda.gov/cdrh_docs/pdf18/P180002B.pdf

- One-way valves placed in airways let air out but not in
- Gradual collapse of lobe(s)
- Reduced hyperinflation

California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

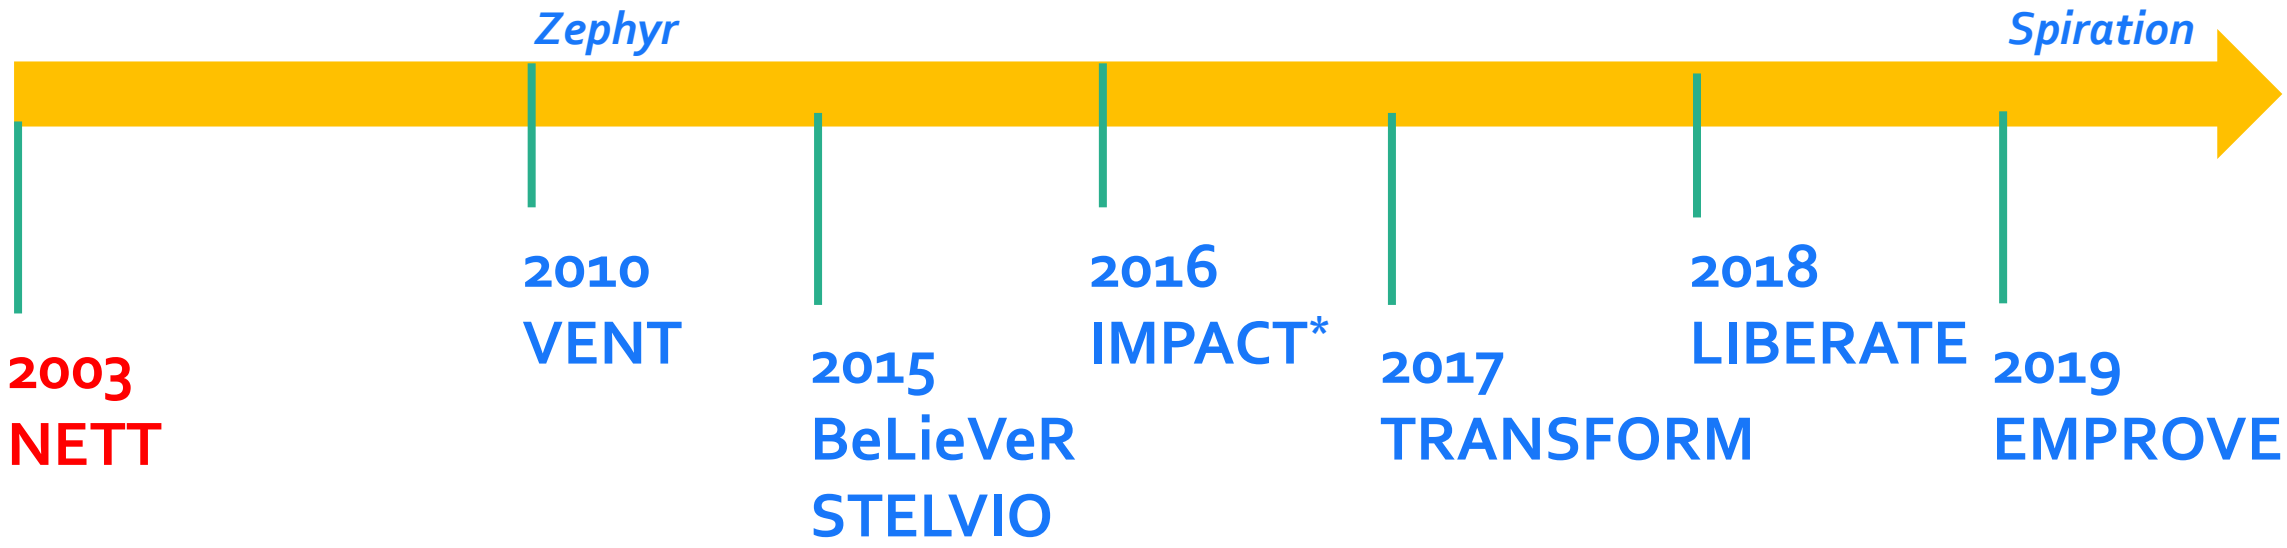
- **Physiologic outcomes of BLVR:**
  - Improved diaphragm length-tension relationship → better muscle mechanics
  - Less V/Q mismatch
  - Improved $FEV_1$



California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

- **Clinical trial data:**

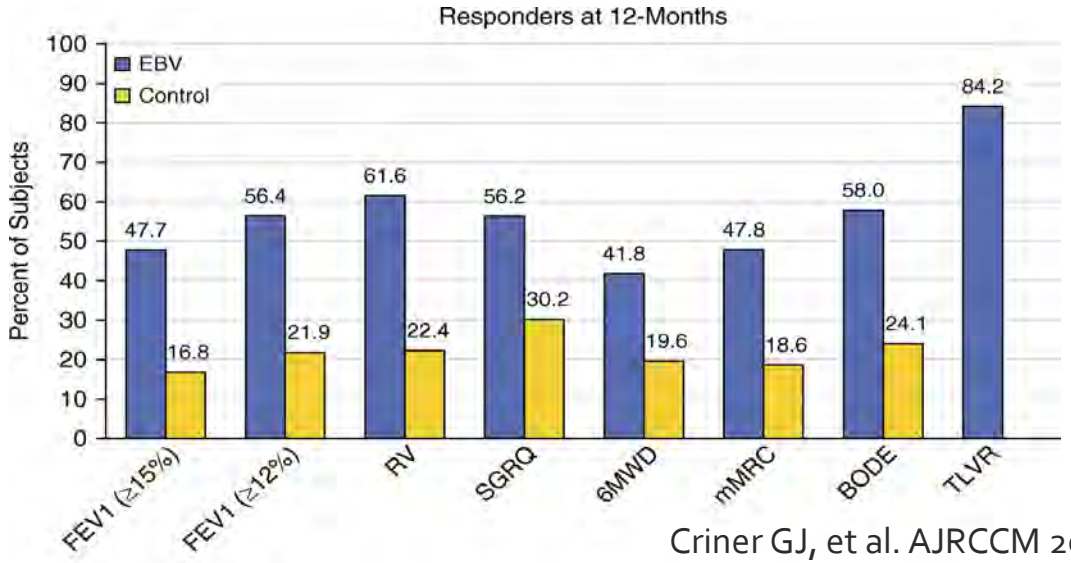


**Homogeneous emphysema*

California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

- **LIBERATE (Zephyr, 2018)**
  - $FEV_1$ 28%p
  - RV 224.5%p
  - 6MWD 311 m
  - Emphysema destruction 70.9%
  - Heterogeneity 25.5%



Criner GJ, et al. AJRCCM 2018.

- **EMPROVE (Spiration, 2019)**
  - $FEV_1$ 30.8%p
  - RV 207.5%p
  - 6MWD 303.5 m
  - Emphysema destruction 63.6%
  - Heterogeneity 25.3%

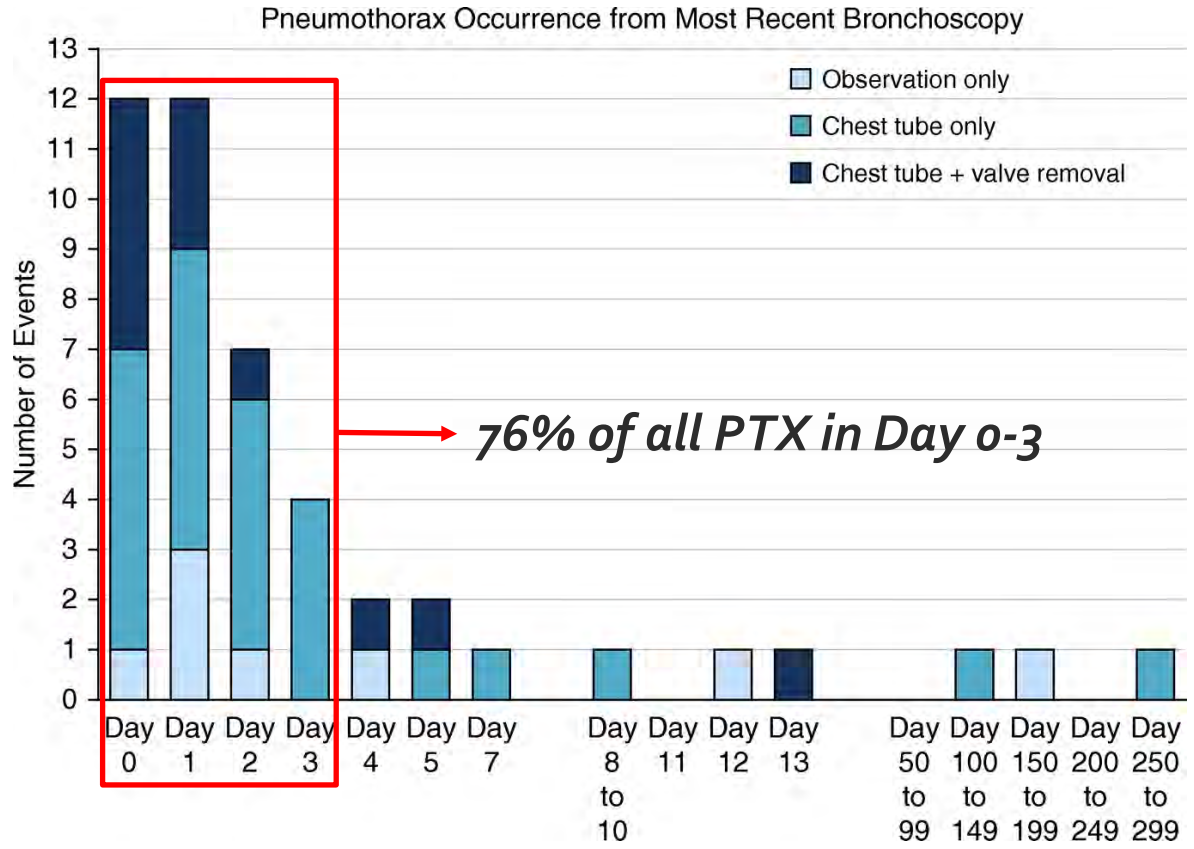
| 12-month outcomes | Valves | Control |
|---|---|---|
| $FEV_1$ improvement ≥ 15% | 37.2 | 5.1 |
| SGRQ reduction ≥ 4 pts | 50.5 | 22.0 |
| mMRC reduction ≥ 1 pt | 48.9 | 7.3 |

Criner GJ, et al. AJRCCM 2019.

California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

- **Risks/complications:**
  - Pneumothorax (26.6% in LIBERATE)
  - No significant differences in other adverse events



Criner GJ, et al. AJRCCM 2018.

California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

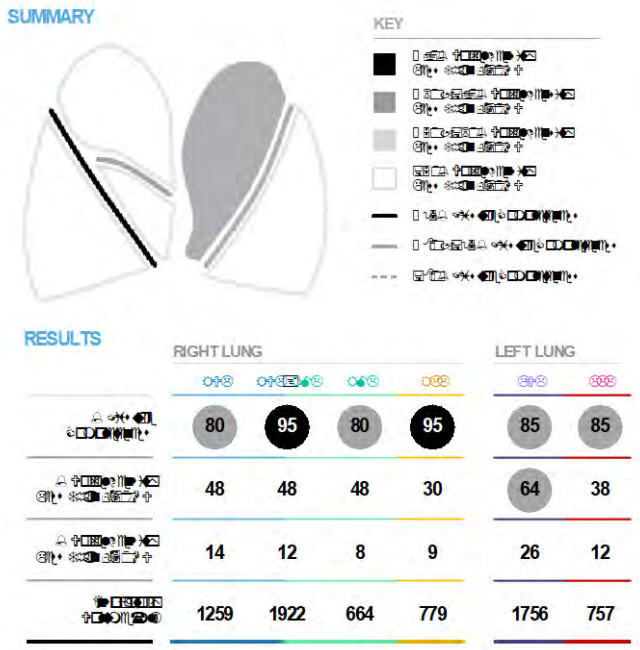
- **Eligibility criteria:**
  - ≥ 18 years old
  - Emphysema with hyperinflation
    - RV ≥ 150-175%p (heterogeneous)
    - RV ≥ 200%p (homogeneous)
  - $FEV_1$ 15-50%
  - 6MWD 100-500 m
  - Quit smoking ≥ 4 months ago
  - Completed pulmonary rehab

- **Exclusion criteria:**
  - ≥ 2 AECOPD hospitalizations in past year
  - ≥ 2 PNA in past year
  - Recent MI or LVEF < 45%
  - Bullae > 30% of hemithorax
  - Prior major chest surgery (LVRS, transplant, bullectomy, lobectomy, pleurodesis)
  - Significant sputum production
  - $DL_{CO}$ < 20%p
  - PASP > 45-50 mm Hg
  - $PaCO_2$ ≥ 50 mm Hg
  - $PaO_2$ ≤ 45 mm Hg

California Thoracic Society

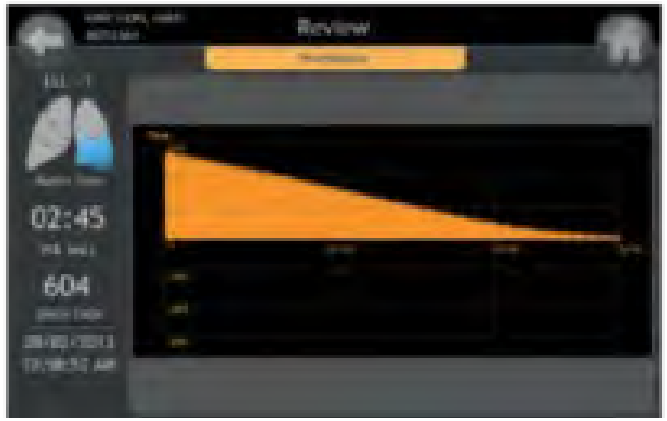
# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

- **Additional testing:**
  - CT analysis to assess lobe volumes, % destruction, heterogeneity and fissure-integrity
  - Balloon occlusion test during bronchoscopy to confirm fissure-integrity (*Zephyr only*)

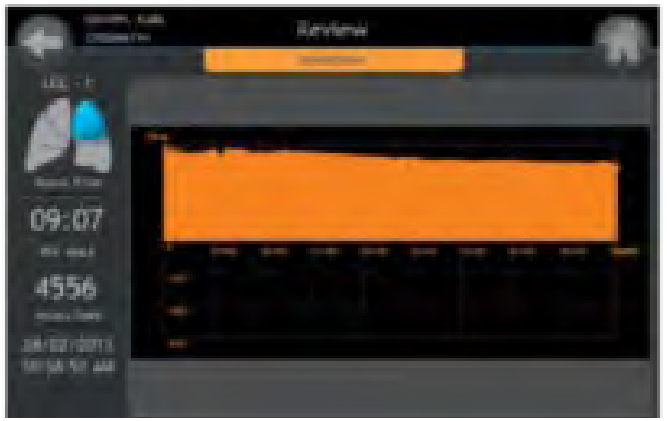


StratX Report (Zephyr)

Chartis assessment for fissure-integrity (Zephyr)



No collateral ventilation (CV-)
Complete fissure



Collateral ventilation (CV+)
Incomplete fissure

Luzzi V, et al. Eur Respir J 2018.

California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

- **Emerging long-term data:**
  - Sustained improvements in RV, $FEV_1$, and SGRQ at 3 years
  - Improved median survival in 1 study (+1.7 years *vs* "controls")

Hartman, et al. ERJ Open Res 2022.
Hartman, et al. Respir Med 2022.

- **BLVR *vs* LVRS:**
  - Nonsurgical
  - Similar efficacy (CELEB, 2023) → Buttery, et al. ERJ 2023 – *early view*.
  - Does not complicate future chest surgery
  - Not limited to upper lobes*

California Thoracic Society

# BRONCHOSCOPIC LUNG VOLUME REDUCTION (BLVR)

- **When to consider BLVR in treatment of severe emphysema:**
  - Symptomatic despite maximal medical therapy + pulmonary rehab
  - Avoid LVRS
  - Delay time-to-transplantation
  - Potential future chest surgery (e.g., transplantation)

- **Biased opinion:**
  - Few interventions address hyperinflation or poor muscle mechanics
  - Pulmonary rehab, NIV, and BLVR should be considered *early* for emphysema patients

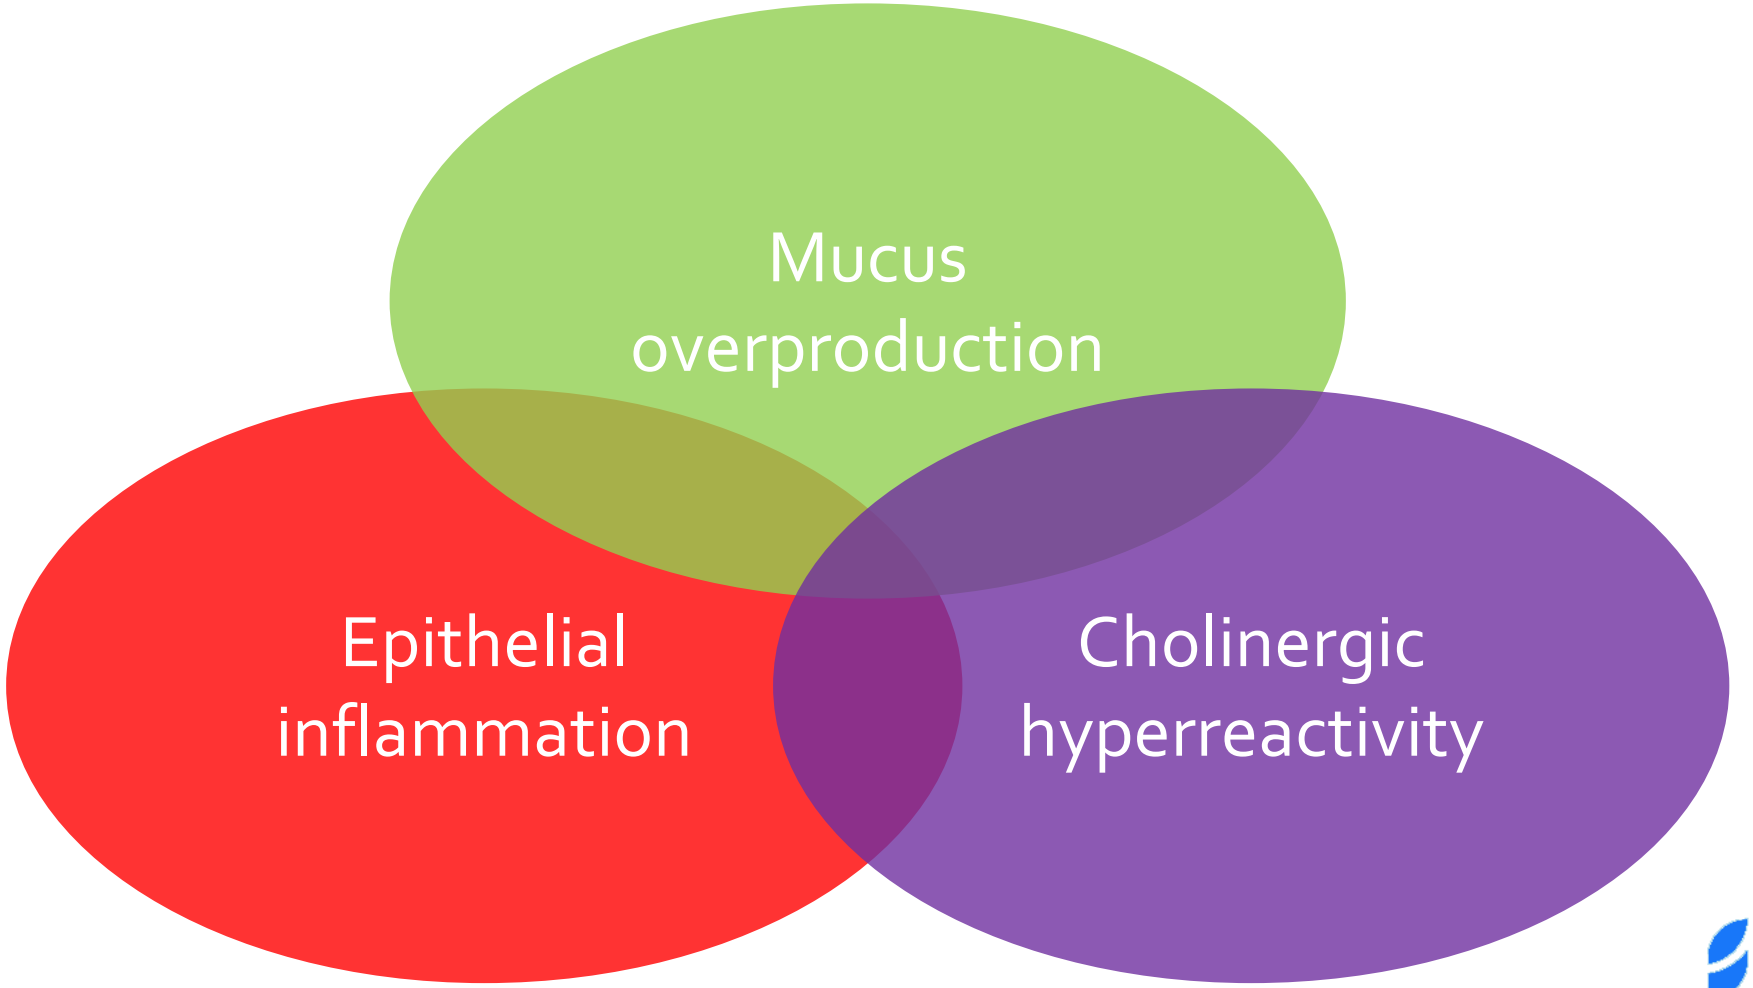
# FUTURE INTERVENTIONS

**Bronchial rheoplasty (chronic bronchitis)**

**Cryospray (chronic bronchitis)**

**Targeted lung denervation (COPD)**

# COPD WITHOUT SIGNIFICANT EMPHYSEMA

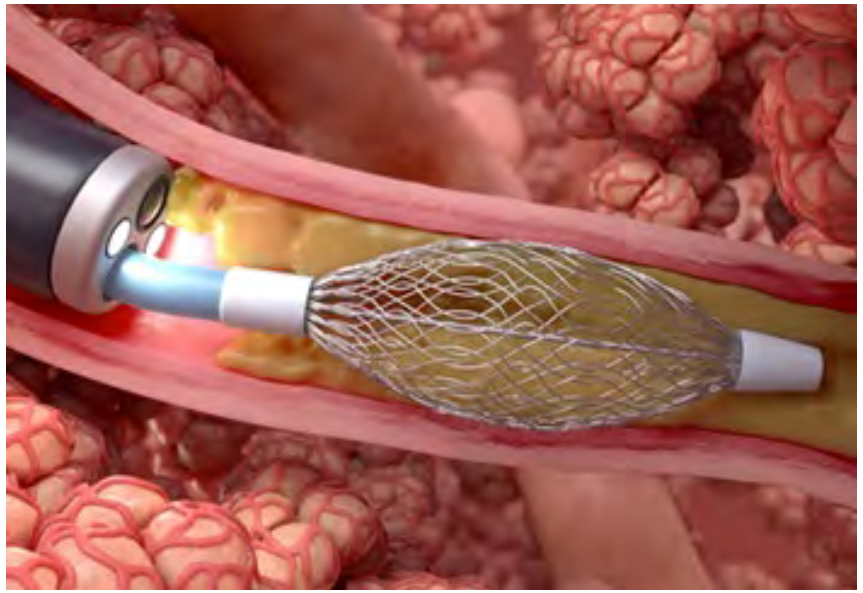


California Thoracic Society

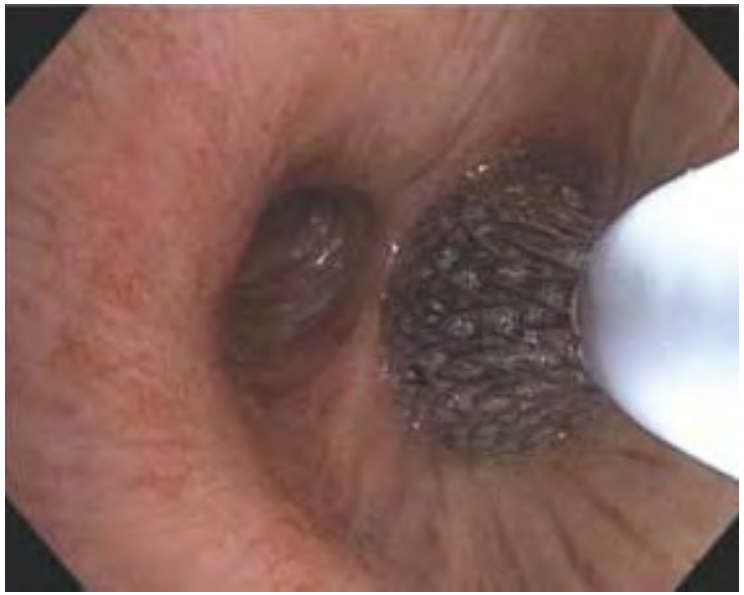
# BRONCHIAL RHEOPLASTY

- Pulsed electric field (PEF) energy to ablate goblet cells

- RheOx system (Gala Therapeutics) granted breakthrough device status in 2019



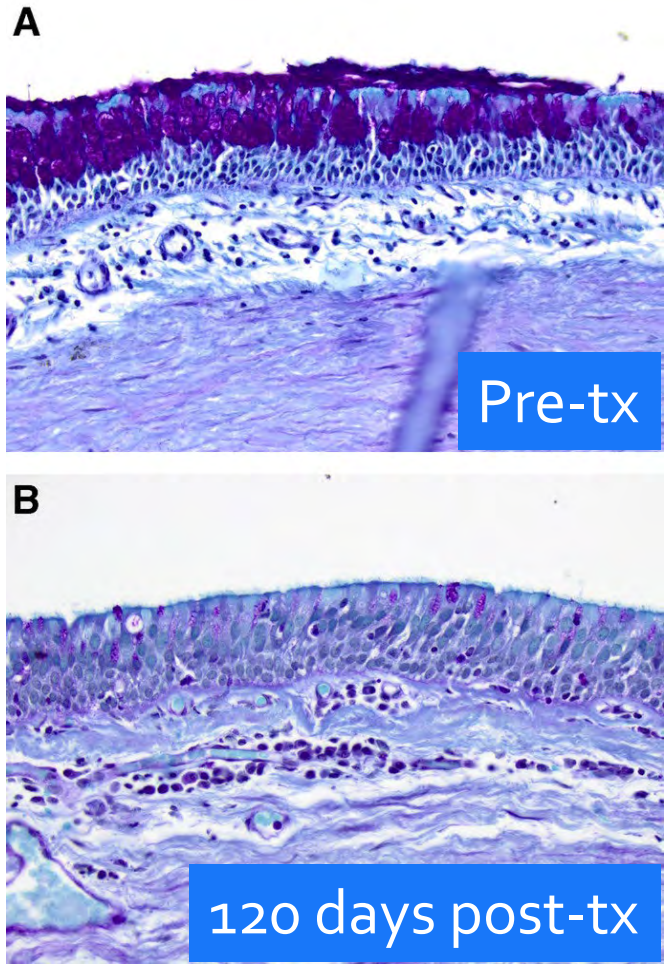
galatherapeutics.com



Sciurba FC, et al. BMJ Open Respir Res 2023.

California Thoracic Society

# BRONCHIAL RHEOPLASTY



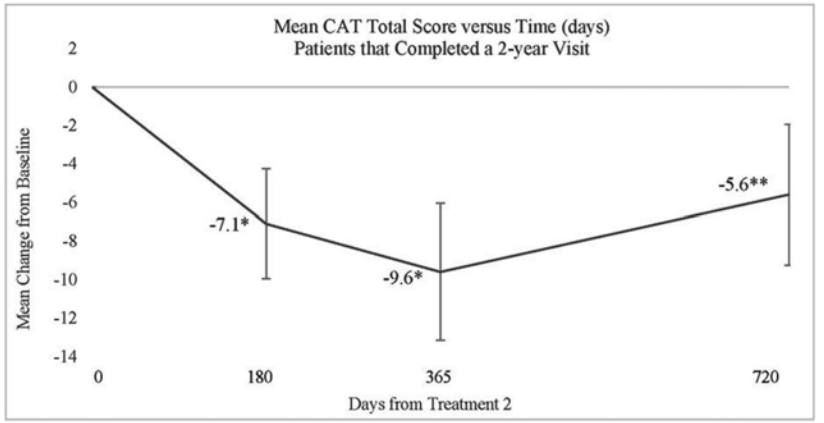
- High-frequency, short-duration nonthermal, pulsed energy field
- Disrupts cellular homeostasis → apoptosis
- Preserves tissue architecture → mucosal regeneration, but with fewer goblet cells

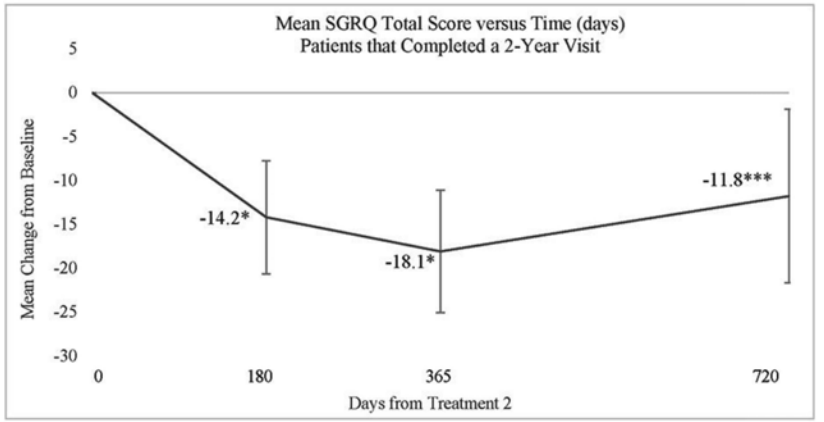
Valipour A, et al. AJRCCM 2020.

California Thoracic Society

# BRONCHIAL RHEOPLASTY

- **Target patient population:**
  - FEV1 30-80%p
  - Chronic productive cough ≥ 3 mo/yr x 2 consecutive years
  - ≥ 10 pack-year smoking history
- **Observational data:**
  - Sustained improvements in CAT, SGRQ, sputum production
- **Adverse events:**
  - Moderate AECOPD, hemoptysis (self-limited)
- ***RheSolve:*** *multi-center, double-masked RCT (completed June 2023)*





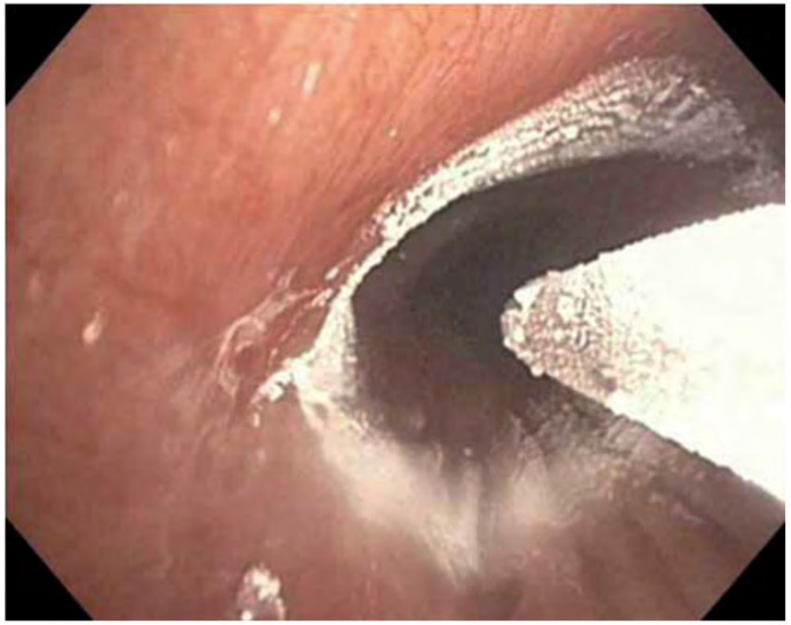
Sciurba FC, et al. BMJ Open Respir Res 2023.

California Thoracic Society

# CRYOSPRAY

- Metered-dose $LN_2$ sprayed in airways to denude bronchial epithelium

- RejuvenAir system (CSA Medical) granted breakthrough device status in 2019

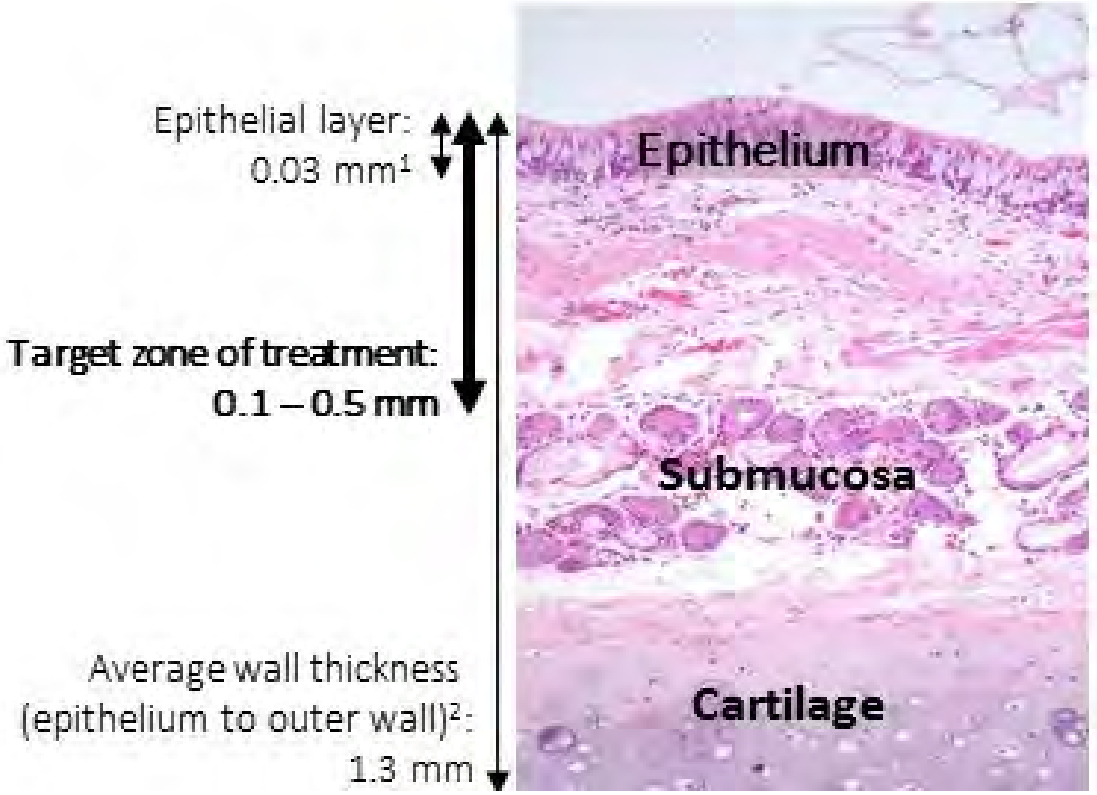


Hartman JE, et al. Eur Respir Rev 2021.

California Thoracic Society

# CRYOSPRAY

- Temperature-drop (-196 °C) penetrates intosubmuco
- Entire epithelium is ablated
- Repopulation with healthy/normal epithelium



csamedical.com

California Thoracic Society

# CRYOSPRAY

- **Target patient population:**
  - Same as rheoplasty

- **Clinical data:**
  - Improved symptoms and sputum production relative to baseline at 9 mo
  - Mean SGRQ -9.6 points relative to sham arm in study of 31 patients at 6 mo

Garner JL, et al. ERJ 2020.
Orton CM, et al. ERJ 2022 (abstract).

- **Adverse events:**
  - AECOPD, PNA, worsening cough

- ***SPRAY-CB:*** *multi-center, sham-controlled RCT (underway)*

# TARGETED LUNG DENERVATION

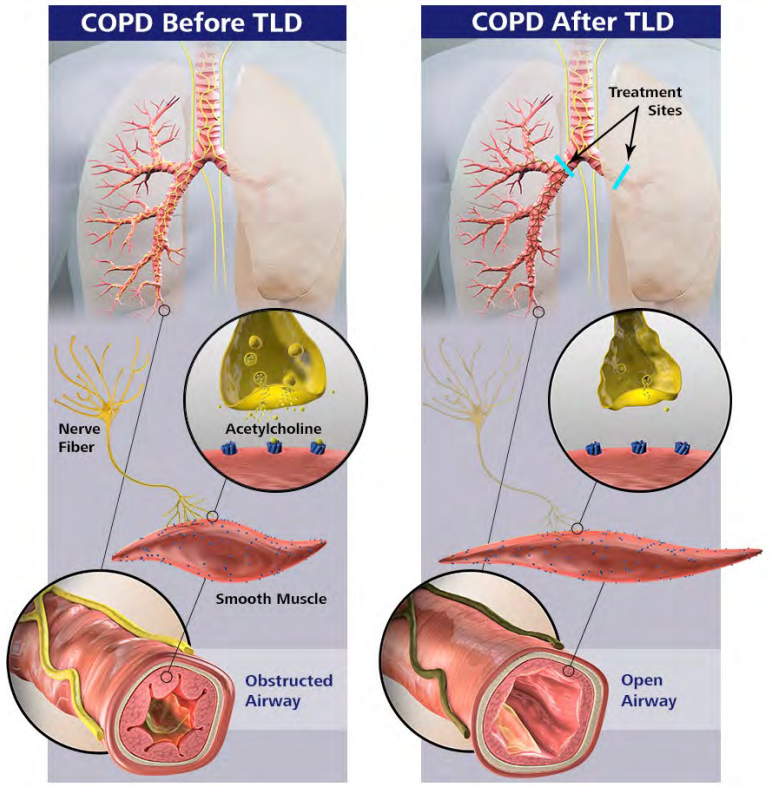
- Radiofrequency ablation (RFA) of vagal branches to the mainstem bronchi

- dNerva system (Nuvaira, Inc.) granted breakthrough device status in 2020

https://nuvaira.com/technology/

# TARGETED LUNG DENERVATION

- RFA disrupts peribronchial branches of vagus nerve
- Disruption of parasympathetic reflex in the airways
- Decreased smooth muscle tone and airway resistance



Neuvaira.com
Hummel JP, et al. J Appl Physiol 2018.

California Thoracic Society

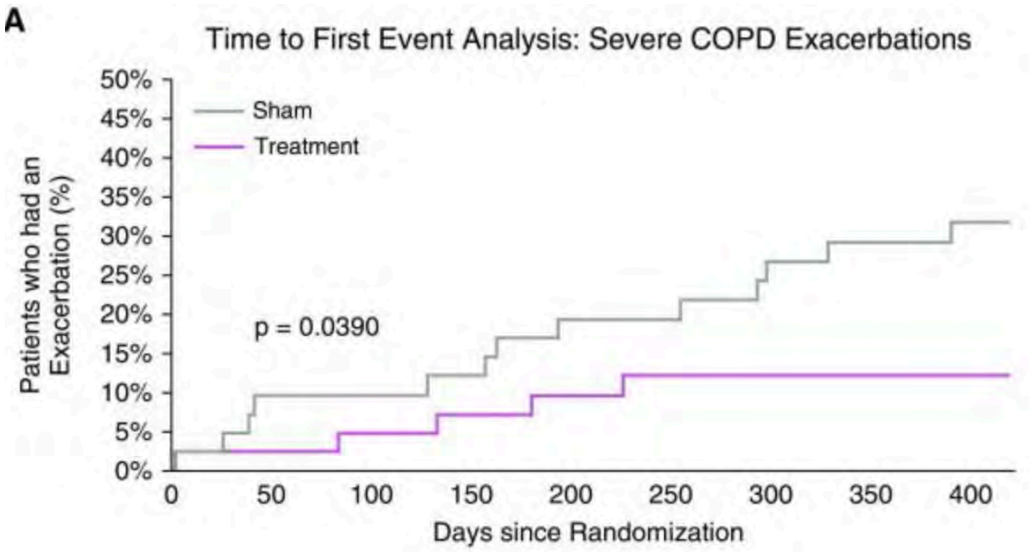
# TARGETED LUNG DENERVATION

- **Target patient population:**
  - FEV1 30-60%p
  - ≥ 2 moderate AECOPD or ≥ 1 severe AECOPD/12 mo

- **Clinical data:**
  - Improved symptom-control, fewer overall respiratory events, greater time-to-severe AECOPD *vs* sham controls
  - Benefit sustained up to 3 yrs

- **Adverse events:**
  - Esophageal complications

- ***AIRFLOW-3:*** *multi-center, sham-controlled RCT (underway)*



Slebos DJ, et al. AJRCCM 2019.

Valipour, et al. Int J Chron Obstruct Pulm Dis 2020.
Christophe P, et al. Respir Res 2021.
Conway F, et al. Respiration 2022.

California Thoracic Society

# SUMMARY

- Interventional bronchoscopy no longer limited to the central airways
  - Several interventions for clinical use or under investigation for treatment of benign small airway obstructive disease
- BT somewhat fraught with uncertainty, losing ground to biologics
- Robust data in support of BLVR for advanced emphysema
- New bronchoscopic treatments for non-emphysematous COPD under investigation

# THANK YOU!

Brian Shaller
